>medium power UHF transistors) as a private customer.
>
>Is the situation the same in other countries?

I've had very few problems here in the UK. Distributors obviously prefer account customers, because they lose money on small orders from individuals; it probably costs them about #25 UK just for the paperwork. You could try giving yourself an official-sounding name, like Bolch Electronics, and say that you are starting up in business and need a few devices for a prototype.

Indeed! Sometimes discussions about mixer "strength"--seemingly a scientific issue--verge on the emotional.

As for amplifiers, here's a start: Wes Hayward, W7ZOI, described and characterized, in terms of gain (+10 db) and IP3 (which I don't remember!), a single-40673 RF amplifier as part of his Progressive Communications Receiver (November 1981 *QST* and most ARRL *Handbook*s of the 1980s).

Yes that's right the forbidden radio. I have a friend that has a few
of these BRAND NEW IN THE BOX for $150.
I'M LOOKING FOR THE MODIFICATION that caused Tandy to pull them from the
shelves before the radio even made it into the catalog.
I can put anyone interested in purchasing one in touch with my friend.

Thanks
Michael

I use to introduce myself, informing that I work for Norwegian Telecomms
and often I am offered to pay 100-prices even when I only buy smaller
quantities, resistors I never buy less than 1000 equal values, but I
never buy for less total amount than ?50.00. I often buy components for
other friends - to increase the volume of the order. Some friends work
for large electronic companies, but they never dare to introduce
themself, therefore they are treated as 'small-order-individuals'.

only once, this tactic did not prove successful, so at last I said "I am
just a poor radioamateur...", and the man replied telling me all the
funny he could think of about radioamateurs who once cleared his store
and he regretted it.....and after all he was friendly against
radio amateurs....

I have a feeling that semiconductor prices are relatively high in
Germany. A OZ-friend sells transistors and bits and pieces, but when he
goes to Weinheim, he uses the same amount in Deutsche Mark (DEM) as the
prices are back home in D?nische Kroner(DKK), and DEM is 4x DKK !
The Germans gladly pays 4 times the Danish price, and they say it is
inexpensive, and indeed it is lot of more expensive German companies
selling components in Weinheim.....

Yes, one I built from a 1954 magazine worked on that principle. My
Physics lab cvourse experiment showed that it did better than a diode,
because tghe unused carrier did power the amkpflier some, but a lot
depended upon the percent modulation.

Hey, old is fun too, and a lot of old works lots better with the newer
and better components. At one time you had to kiss a lot ofd
transistors before you found the princess that would ampfly well at
microamp currents.

An easy answer is to put a dropping resistor in series next time you
replace the bulb. 100 ohm or so.
This helps the life by limiting the inrush.

Source record: 84350

Hi,

I picked up a General Radio Variac (W20M) and I'm not sure how to wire it. There are 5 screws located inside labeled 1-5. Screws 2-1 say 20v, screws 1-5 say 95v, screws 5-4 say 20v, and screw 3 is the wiper.

If I connect 3 to the line and 1 to the load (common neutral) I get a 0-117 volt output.

If I connect 3 to the line and 2 to the load I get 0-117-97.

My goal is to get the 0-135v that is marked on the dial. My thinking is that it's currently configured as a reostat(sp) and not an autotransformer. The neutral should probably be connected to one of the screws? Any help would be appreciated.

Please respond to my mail account also.

Thanks,
Brian B.

very well, but since the efficiency for the output stage is only 25% or
less higher output is achieved feeding the detector output directly to a
loadspeaker, or use a matching transformer.

Another answer is to get in touch with your local classic car spares
company. MGs (60s and 70s vintage) Used 14v bulbs in their dashboard
switches. These are small screw in ones about 3/8ths long and 1/8th
diam and are still available.

I posted this message yesterday. For some reason, it seems it never made it to the news server.

I am in the process of upgrading my 1/4 wave ground-plane. I am looking to build a quad or a yagi. I haven't seen many homebrew dual band (2 m/440 MHz) on the net. I might build 2 antennas (one for each band).

The problem I have is that even if there are many designs on the Net, it is nearly impossible to find one that is complete. Some will show part of the calculations but will not say much on how to drive the elements.

Others will show you how to drive them but will not address the fact that they have to be tuned...

Since they all come from different source, it is nearly impossible to get even results as it seems that they were designed from different formulas.

Could someone recommend a good and COMPLETE plan that can be built by your average technically inclined ham ?

Stay safe !

One of the surplus stores here in Portland has a whole pile of old Motorola radios for sale. The model (I think...) is MOTRAC-70 and stickers on some of them indicate they were set up for ~150MHz. Is there any information on line about these radios? I'd assume they could be re-crystaled for 2m. Didn't see any control heads, so I'd be especially interested in the pinout for the control connector. Is this a common unit / boatanchor?

Thanks for any info,
John Reynolds N7IW

Hi John,

My suggestion to you would be let a sleeping dog
lay.....
Motorola builds a very good radio but, they are
built for the 150-160 Mhz part of the band and it
is more than just a re-crystal job for 2-meters.
It can be done but, be ready to change several
componets it the rec. and trans. sections. You
would be much happier with some later model stuff.

From: Will White <wcw@asu.uswest.net>
Message-ID: <352088BC.DF519B5D@asu.uswest.net>
Source record: 84364

Where are kits or plans for a small (2-3 watt) audio amplifier I could build into an outboard speaker for use with several radios I have with sub-par audio?

Will White

The power sucker radio was also called the free-power radio. You use a tuned rectifier to generate voltage from a strong station to power a transistor AF amplifier connected to a crystal detector in most schemes. The alternate to the power sucker radio was the lemon-sucker (no kidding) where you used a series of lemons with copper and silver electrodes (normally pennies and dimes!) to generate voltage to run the AF amplifier. I suppose the lemon-sucker radio would also make good lemonade! (hi)

One of the favorite transistors was a germanium junction made by Raytheon called the CK-722. It came in a small box used to box tubes and cost about $4.00 in 1952. It was about the size of a pencil eraser. More circuits were developed around the CK-722 than any other transistor. Even long after Raytheon quit making the CK-722 you could buy them on the surplus market.

Probably the neatest radio was the Gillette razorblade detector. You would use a rusty double-edge razor blade with a cat-whisker like in the old galena detectors. You had to go through several razor blades to get a good detector, searching for an oxide spot (rust) with the cat-whisker! Tuning was done with a coil wound on a Quaker Oats box and a slide bar across the winding.

I did not want to write an encyplodaedia but just copied the table
from the 1974 article mentioned. Of course, from 1974 state-of-the-art,
the +30 dBm triode mixer from the Rohde&Schwarz EK-07 communications
receiver (1960) is missing.

> Such a mixer has
> yet to appear in an commercial amateur-oriented transceiver, probably

> power MOSFET mixers in consumer gear hazier still.)

Use 4 * SD210, good for upto +45 dBm IP3 in the Telefunken E1800.
(They terminate the mixer with a 90°hybrid, have 2 crystal filters in
the
divided ports and recombine after the filters. Impressive.)

> Mixer "strength" is

> Whenever we see dynamic-range measurements qualified as "noise limited,"
> we're seeing another in which where synthesizer noise beat out mixer
> "strength."

Yes, that's the real problem. If I can't get a nice synthesizer, I don't
want no synthesizer at all. I want clean signals and can do without 99
"channel memories". DJ7VY showed he needed an oscillator with -164
dB/Hz
phase noise in the distance of your choice (let's say 10 or 20 KHz).
This cannot be done with general purpose laboratory signal synthesizers
but with a VCXO, for example.

The best things that happened to ham radio were the Icom IC-202 with
it's
VCXO and the Drake TR7.

> Raw front-end strength is not necessarily overridingly important to many
> users, and understandably so.

This depends on where you are. Here in Europe, we have Radio Moscow on
7.100 MHz with S9++++++++++, and they are not alone.

Even more, imagine the problems you get when you have a club station on
the
roof of a large building in a somewhat larger city, and a 2 meter EME
capable
antenna array. Dozens of hams in line-of-sight who operate rigs with
oscillators that look like noise generators with a somewhat
pronounced maximum. It won't be easy to make friends.

I got somewhat carried away with mixers, but J.M. Nöding asked about
IF amplifiersfor the R4C. I don't think that you can change the
behaviour
of the R4C to a great extent by changing the IF amplifier. There are too
many
stages in front of it. This IF amp sees only a 10 KHz or so window if
i remember right. OTOH the R4C has a nice preselector that helps a lot.
If you really want to change your R4C, don't do anything that can't be
undone because it will be a collectors item sooner or later.

Greetings from Berlin,

Gerhard

Postscript to the above, in case anyone else ever runs into this kind of problem...

The MC10EL33 works well with sine-wave inputs down to about 20 MHz or so. Below that, a sine-wave input will not meet the part's (wholly undocumented) input signal risetime constraint, and clocking becomes unreliable at best.

One simple, elegant solution which allows clocking with sine-wave signals down to near-DC with the MC10EL33:

...where CR1 = a GE tunnel diode stolen from a junked Tektronix oscilloscope. :-)

Below a few dozen megahertz, the tunnel diode is driven into its negative-resistance region by the rising edge of the input sine wave, resulting in a very abrupt edge with a risetime in the tens of nanoseconds which is independent of the actual signal frequency. This signal is well-suited to driving the 10EL33's input stages at low frequencies.

Above a few dozen megahertz, the tunnel diode starts exhibiting a substantial amount of resistive loss, effectively removing itself from the circuit once it's no longer needed. With perhaps a few pF of capacitance across the 560-ohm resistor, and proper layout and coupling techniques, one could easily build a frequency counter with coverage from near DC to the 10EL33's limit of 4 GHz, with absolutely *no* range switching required.

Don't forget the amazing British clockwork radio!

When I first saw the advertisments I thought it was a joke but it's
apparently a sensible idea for countries where batteries are expensive
and difficult to find. You wind it up and as the spring runs down it
powers a small generator which powers an AM/FM radio good enough to get
the local broadcasts.

Well ,

here I go.

The 26db Bipolar amplifier using 2n5109 CATV transistor
and 50 OHM input and output impedances should
work well enough as an IF amplifier. This amplifier
is described for use as a RF amplifier in the ARRL handbook
and has 30+ db IP3 .

And you can use a PIN diode attenuator for AGC

regards

Kind of a feasibility study here, but how many would be interested in one if one was to be built and what reasonable features would you like to see?

Software switchable multiple baud rates is one that I can think of right off.

What price range? I know, the cheaper the better but let's be realistic here. What would you be willing to fork over for one?

I'm going to design one just to do it for the experience but if the bucks are there, maybe I could go have a quantity mass produced and offered on the market.

Source record: 84446

Allen,

Hallicrafters made a hetrodyne VFO back in the mid 1960s...

The model number was HA-5... It used a super-stable 5.0 - 5.5 MHz
tunable oscillator, the output of which was mixed with a crystal
oscillator. Both oscillators ran continuously, thus reducing temperature
drift. T/R switch (and keying when using CW) switched the mixer cathode.
Price was $89.50.

BTW - I worked at Hallicrafters in the QC dept during the period when
this unit was being manufactured and bought one through employee sales.

3504. Using a static RAM instead of an EPROM

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-31 00:00:00 UTC
From: Robin Birch <robin@falstaf.demon.co.uk>
Message-ID: <R3rDWDAaQCI1EwM8@falstaf.demon.co.uk>
Source record: 84367

Some years ago the technicians at work used to use what was effectively an 8k by 8 static ram instead of an 2764 EPROM for developing code, it was a lot faster and more convinient than continually blowing and erasing proms.

If I took an 8k by 8 and put a 5v battery on it, what would I have to do to the other pins so that I could put it into a PROM programmer and write code into it without blowing it up?.

Cheers

Robin

PS If someone has got the data sheets for a bog standard 2764 and a 6264 then I may be able to work it out myself.

Cheers

Robin

3510. Programming an IC-22S

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-31 00:00:00 UTC
From: kmchar <kmchar@ozemail.com.au>
Message-ID: <6fqg47$n1q$1@reader1.reader.news.ozemail.net>
Source record: 84373

Hi

I have been given an IC-22S but no instruction manual, the previous owner has said that you can program frequencies into the radio using various sequences of diodes but can't remember how to do it, he had someone else set it up for him.

I would like to know how to set the programmable frequencies using the diodes.

I have had a look inside the radio and there is a circuit board setup with 22 columns, this is the number of channels available, and along the rows there are numbers like
2,4,8,16, 32, 64, etc.

Can anyone please explain to me what this means?

Source record: 84374

I am not sure quite how this dicussion started, but I have found that, between 500KHz and 300MHz, nothing in the 3NXXX range will touch a genuine 40673 for dynamic range. Oddball notes on 40673's. They can really produce noise below 500KHZ. The conversion "gain" can vary considerably device to device. Thats my two pennys worth !

You can actually buy these. I'm using ST MK48Z02Bs (originally developed
by MOSTEK, they have a built-in Li cell) instead of EPROMs with a simple
home-made programmer (just a 4040 counter for the address lines)
connected to the PC printer port. They are only 2K X 8, but fine for my
purposes. Dallas does larger ones, stocked by Farnell, up to 32K X 8.

I've built many variations of razor-blade sets butnever heard of the "rusty-blade" idea. Mine use a single-edge "white" (not blue) blade, and a graphite from a #2 pencil. The coil is wound on the core from a roll of paper towels or TP, and the graphite is held in place by a bent safety pin nailed to the baseboard. You have to fuss with it, but almost any blade and graphite would work.

The only "real radio parts" are the high impedance headphones and the wire. The wire can often be scrounged from old TV deflection yokes.

Some folks claim that these detectors behave more as coherers than as diodes, but I won't comment on that.

What you really want is an EPROM emulator. Check in Embedded Systems Magazine. Some are available for around $150.

If that is to pricey, Leon's suggestion is a good idea, although you should consider how long it takes to load the code into the RAM chip. Surely it is quicker than programming an EPROM.

Good luck,

Tom

Don't overlook the (semi) obvious - EEPROM. For example, I've been
using 28C64s for years as an alternative to EPROM. If you look around
you can find them rather cheaply (under $10). Some *really old* parts
might not be usable, but modern ones are single supply with data-polling
during write cycles.

I program them in my EPROM programmer (with a EEPROM setting, of
course), though you can do it a RAM socket if you write a little
routine to do the write polling.

The very best 813 amp I remember was one published in either the GETube Facts pamphlet or a similar publication by RCA. (Can't remember which anymore.) I had about six of those tubes, and gave them to a friend here who built an amp around two in push-pull, using that circuit which I also provided. Think it was originally designed for Class C, but we redesigned it for AB1.

Paul--

Don't try to work with the MC3363. It's available ONLY in surface
mount, with pins so small they'll drive you crazy. You need some
experience and special equipment to work effectively with surface
mount chips.

Instead, consider the MC3362, which is a slightly earlier version of
the MC3363, which lacks the transistor for the front end RF amp.
However, if your repeater isn't too far away you should hear it.
There was a circuit in Ham Radio magazine years ago (1988 maybe?)
giving a circuit and circuit board for a resistance-tuned minimal
repeater monitor using the 3362. I built it and it works. I also
make a circuit work using a crystal, but only on 6 meters. The
circuit wasn't designed for crystal control and using crystal control
is a little touchy. You're better off trying it with a ten-turn pot
to control the frequency.

Try building a simple, resistance-turned circuit before you try to add
a synth.

Good luck and let us know how you do.

3525. Email reflector for collectors of OLD tube type ham Gear.

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-03-31 00:00:00 UTC
From: Eugene Rippen <soundval@foothill.net>
Message-ID: <3521A060.8E1@foothill.net>
Source record: 84388

For those interested in older ham gear, tube type items and accessories,
including homebrewers, there is an Email Reflector called baswaplist.
It is FREE. It has over 600 subscribers

IT IS FOR buying, selling and swapping of :
Tube Type and Older ham equipment, parts, accessories, and
manuals and catalogs.
Books and periodicals concerning tube type equipment and older
ham gear.
Single one time announcements of swap meets. Though, NOT
including who will attend or what specific items will be
offered.

IT IS NOT FOR:
Discussions.
Commercial advertising other than for the sale of specific
items of the nature described above, and with prices
and quantities. In other words, no institutional type
advertising.

LIMITED (but not totally banned) ARE:
Repetitive ads.
Auctions. An auction is considered to be any ad of items for sale
that expressly or impliedly requests offers.
A reasonable amount of ads relating to Tube Type Domestic
Broadcast Receivers and Parts are permitted.

Persons, whose mail repeatedly bounce, are removed from
the list. They can, of course, subscribe again.

TO SUBSCRIBE: SEND Message to: majordomo@foothill.net
In MESSAGE body SAY ONLY: subscribe baswaplist.
Then the email address of the sender will be added to the list.
To unsubscribe do the same, only say "unsubscribe" instead of "subscribe"

This list is CASE SENSITIVE as to the addresses of subscribers, that
is regardless of whether your ISP at your end is case sensitive. Mail
that comes from a sender whose address does not PERFECTLY match
the address on the list of subscribers is bounced. This is installed as
some prevention to the list being used for spamming.

Messages sent directly to me requesting subscribe or unsubscribe may
be ignored, or at best sent some kind of prepared boiler-plate
notice.

I run the list. I am Eugene Rippen. Flack may be directed to me
at soundval@foothill.net

Kelvin:

I used to have one of those rigs but gave it away some years ago.
Your best bet is to find somebody that would be will to
make you a copy of the manual to determine
the frequency setting arrived at by placement of the diodes.

Alternately, some guys used to solder switches into one
of the channel locations (each of the diode locations for
one channel) then manipulate the switches to change
frequency. If you have a frequency meter this would also
serve to identify the layout/logic for the diodes and
thusly you wouldn't need that manual anyway.

regards,

Shawn WB6JWB

Hi, Henry --

It'd probably be worthwhile for you to pick up the latest edition of Rohde et al.'s "Communications Receivers." There's not much they don't touch on. Try http://www.amazon.com/exec/obidos/ISBN%3D0070536082.

Sabin and Schoenike's latest edition is listed at http://www.amazon.com/exec/obidos/ISBN%3D0079120385. Seems like it only just came out yesterday, but according to Amazon it's out of print. Bill Sabin pops up here occasionally; you might ask him for some alternative recommendations.

Hayward & DeMaw's "Solid State Design for the Radio Amateur" is still a great book. You wouldn't look there for advice on the latest synthesizer techniques, but the rest of the rules of the HF receiver-design game haven't changed much in the last 15 or 20 years, and most of 'em are in there.

Wes Hayward does have a newer book, "Introduction to Radio Frequency Design," at http://www.amazon.com/exec/obidos/ISBN%3D0872594920, but it's on a long lead time.

And, obviously, the latest editions of the ARRL Handbook are likely to be useful to you, but then you've probably gotten that far already.

Check out your local hobby or model railroad shop. 14 and or 16 volt
grain of wheat and grain of rice (smaller) bulbs are standard.

Before I had a 'real' EPROM emulator, I used to use
an E2 (EEPROM). You can get 'em in JEDEC format.
ie... I used a 2864 in the place of a 2764.
Most EPROM programmers will do E2 chips.

It shure beats the monotonous task of the
program-test-erase cycle of using EPROMS to develope code.
Even when I had several EPROMS on the go, sooner or later
you catch up to the point where you have no blanks, especially
when your software bugs get smaller.

Howdy Stig
I've worked with wire LPDA (Log Periodic Dipole Array) antennas some installing them and helping construct them a couple of times. They feed at the narrow end (High Frequency end) typically through a 4:1 or 6:1 balun across the two center parallel feeders. In our case we built them with the center feeders actually parallel and drawn tight as the support "boom" of the array. The actual elements have to criss cross to attach of course. We put the balun right at the antenna like I mentioned and ran coax to the RF gear. The antenna (if designed right) is broadband so no tuner is normally required BUT does exhibit peaks and valleys of SWR response through its range (you'd see this if you swept it with an SWR analyser). 16 element should be a good working system.

Good Luck.

Gord

Your "prizes" sound to me like MOCOM-70 motorola units, and if originally set up for the lower end of the commercial VHF band they will require "only" recrystalling and realignment to put on ham freqs. This model radio used the same cabling as Motracs and the control wiring is not hard to come by. If you REALLY are that interested I could probably send you a copy. Using such radios for mobile use is kinda undesirable due to the cost of each channel and the scarcity of channels available even if you own the crystal company. Many hams use them for repeaters (separate transceiver for rx, another for tx since the Moc-70 is a 1-piece tx/rx motherboard thus allowing for no real isolation for duplex operation).

Hi Henry,

Henry Pasternack wrote:

> Anyone out there doing state-of-the-art homebrew HF receiver design?

> out of date. Suggestions would be appreciated.

Try "Communications Receivers : Principles and Design", second edition, by Ulrich L. Rohde, Jerry C. Whitaker, T. T. N. Bucher, Jerry Whitaker, ISBN: 0070536082.

The ARRL magazines "QST" and "QEX" have published a number of articles in the 90's on high-dynamic range receiver design, including several by Rohde. As I recall, they've covered low phase noise synthesizer design, high intercept mixers and RF preamps, and a post-mixer diplexor/IF amp design. It'd be well worth it to track down those articles.

There's also an article in the April 1998 QST on an image-rejecting direct-conversion DSP receiver, using an R2 receiver for the front-end and a Motorola 56002 DSP evaluation board for the back end. This style of receiver is also called an I-Q receiver.

The basic idea is to split the RF input in a 0-degree hybrid, then drive two direct-conversion mixers. One mixer gets the straight local oscillator signal, the other gets a quadrature (90-degree phase shift) version of the L.O. Take the two baseband audio outputs, amplify them a bit, phase shift one channel by 90 degrees relative to the other channel, and sum the channels to get the USB, difference them for LSB. In the DSP implementations, the audio baseband signal is sampled and quantized after the preamp, and the audio 90-degree phase shift is done in the DSP.

I'm interested in designing and building a general-coverage HF receiver using a similar approach. One problem with direct-conversion (D-C) designs is that the local oscillator has to cover a wide range. A direct PLL synthesizer would seem to be pretty complex - you'd need a lot of VCO's to cover 100 kHz to 30 MHz. And you'd still have the problem of generating a quadrature L.O. output. So I've been considering using a pair of the Analog Devices 9850 (or somesuch number) direct-digital-synthesizer chip for the quadrature L.O.

It looks like one might be able to get two 9850's to run in quadrature if one was very carefull about reset and programming timing. Alternatively, Harris makes a quadrature output numerically-controlled oscillator chip, but it's kinda slow (only 100 MHz) and requires external DACs - and I'm no expert on specifying DACs for DDS applications.

While the DDS approach for the L.O. has good close-in phase noise characteristics, it does have the problem of fairly large spurs. I'm thinking that if I can stay well under 1/3 of the DDS clock frequency, I can handle the spurs by a set of switched bandpass filters on the RF input. This should help the intermodulation performance of the mixers, too. The 9850 clocks at 125 MHz, so the spurs should be fairly far spaced from the desired L.O. frequency at 30 MHz and under.

For the mixers, I'm thinking of using high-level diode DBMs to get a high IP3. I believe Minicircuits has some level-17 mixers at quite reasonable cost (like $5 to $6 range). It might be a problem getting enough L.O. power (+17 dBm) to drive the suckers. I think the R2 uses level-7 mixers - kinda weak for good IP3.

For the baseband audio preamp, I see that Linear Technology and Analog Devices (and maybe others) now have excellent extremely low-distortion, extremely low-voltage-noise audio opamps. I'm thinking I'll avoid the diplexor problem by just terminating the DMB into a 50 ohm resistor to ground, and driving an LT1115 audio opamp configured for switchable gains of +3, +10, and +30 (10, 20, and 30 dB). This should give an adequate noise figure for the lower bands without an RF preamp. I'll probably need an RF preamp to get an adequate noise figure above 20 MHz. The switchable gains are for the analog part of the AGC.

Now comes the good part. I see that Crystal Semiconductor has stereo 24-bit A/D's spec'd for 117 dB of dynamic range! Just feed one of these from the outputs of the opamps, add a single-pole R-C anti-aliasing filter, and you're in business.

I'm thinking of using an Analog Devices 32-bit floating point SHARC for the DSP. One of the Motolora 24-bit fixed point DSPs would work, but they seem to be slower than the SHARC, and floating point reduces the need to carefully scale the integers in the DSP algorithms. Analog Devices advertises a SHARC evaluation board for $185, including C compiler.

I'd appreciate comments and suggestions on this outline of the design. Thanks.

Regards,
-Steve Byan <smb@world.std.com>

Thanks for the info, folks.

Based on recommendations I have received, I'm going to check out Carver's AGC/IF subsystem from QST for May, 1996, which I understand is superb. Far Circuits (http://www.ci.ais.net/farcir) has inexpensive PC boards for this and dozens of other radio circuits. I was also referred to recent ARRL Handbooks for a design for a very strong D-MOS mixer, and to Hayward's book for information on homebrewing superior crystal-lattice IF filters.

I've got some reading to do, evidently.

Not so, and am afraid you'll never get rid of the spurii to much below 60-70 dB with that approach. (with today's chips). Gonna have to go to a cleanup loop to get them down to where it doesn't significantly detrimentally affect the radio. They aren't aliasing spurs, they're due to numeric truncation in the most part. They are close in, and are dependent on what the divisors are. You have one set of spurs, and change the frequency 0.1 Hz and you get another completely different set.

3545. List of the rec.radio newsgroups (brief)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-01 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6fs89d$67h@news.Hawaii.Edu>
Source record: 84315
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.digital.misc

In an effort help ensure a poster's article reaches the appropriate audience, below is a list of the rec.radio newsgroups. In most cases, a group's name will explain its purpose. Cross-posting should rarely be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-running thread results from a single cross-posted article, and the contents of such a thread drift further and further away from being "on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups" posted on the 15th of each month.

>be modded to put out more?

I built one. It works better than advertised. If you're careful with
how you align it, you may discover that in some places in the 6 meter
band you can put out close to 15 watts (this was measured with
recently calibrated gear in to dummy load). Eight watts is a pretty
conservative figure.

The main consideration if you wish to change the power output of this
unit is heat dissipation. I backed off the power output of my radio
just so that I wouldn't destroy the output transistors of the
transverter.

Using my (unblocked) Kenwood TS-50 as an IF exciter, I was able to
break squelch consistently with less than .1 uV of signal.

The only caveat: I live in a relatively quiet area, free from heavy
duty IMD sources. I don't know how well this transverter will work
under the influence of strong local signals.

Darn. I'll have to re-read that datasheet; I thought the big spurs on the Analog Devices part were from aliasing of the clock. If I've got to make a tracking PLL to clean up the L.O., them I'd better go re-examine what it takes to buld a wide-range PLL synthesizer - that might end up simpler than a wide-range cleanup loop.

Or is there some trick to making a wide-range cleanup PLL, so one doesn't have to switch between lots of narrow-range VCO's?

Regards,
-Steve Byan <smb@world.std.com>

3551. Wanted: Blown Mikes

I'm looking to buy old microphone shells from deceased bullet type mikes, (Astatic JT30, Shure Green/ Brown bullets, Turner, etc.). Mikes need not be working, elements can be blown. I'm interested in the exterior shell (casing). Tell me whatcha got. Please email me direct.
Thanks!

As far as the synthesizer goes, no, you probably won't want to drive the mixer directly with a single DDS chip in a high-performance receiver design.

But those phase-truncation spurs are deterministic and predictable. They're related to the "glitch" that occurs in the output waveform when the phase accumulator rolls over. It seems to me that the best way to attack phase-truncation spurs might be to cascade two DDS chips. The first would serve as the clock generator for the second, possibly with a frequency doubler between the two. The microcontroller that runs them could be configured to select a clock rate for the first DDS that, when used to drive the second DDS, results in minimal phase-truncation spurs at its output.

I haven't given much thought to the math involved, but it seems that you should be able to (a) reduce the final output spurs in amplitude; and (b) move them well outside your preselector passband, through judicious choice of the two DDS clock frequencies.

As far as a trick to making a wide-range cleanup PLL, in the words of Walter Sobchak in The Big Lebowski, "You've entered a world of pain."

In the most recent Nuts & Volts Magazine, the ad for Alltronics at the
end shows a 1-watt transmitter that will work (according to the ad) on
2 meters. $24.95. I just sent for one out of curiosity. It
supposedly can be tuned from 100 Mhz to 150 Mhz. Not sure if it has
any modulation or modulation inputs on board.

It looks pretty small; maybe not matchbox size.

Good luck and let us know what you end up doing.

I have a friend who has one and he really likes it. He is a long time CW man. The little MFJ antenna tuners will help you make some temporary antennas work pretty good. I like dipoles. You will just have to string some things up and see what works.

Good Luck

Nearly all articles about HF receivers to build are in QRP magazines and advertising. Receiver construction is not very common these days. Good Luck.

I believe that the second edition is published by the ARRL. (The first edition, now out of print, was from Prentice-Hall.) You might check with the ARRL for availability.

Does anyone know where I can obtain detailed information on
programming Motorola MCX-100 VHF range 2 radios? I need
information on the VCO step bits in the prom.

Thanks,
DG

Since a recent round of military disposals, there are now many RACAL RA1772 receivers that have found their way into amateur shacks.The mixer in these is almost exactly that from Rafuse's pioneering paper.

A couple of years ago, AOR introduced a little HF Rx, which I believe was designed in the UK by the man who designed the Lowe receivers, and has a switching Mosfet mixer in it. I can't remember the model number, but it's the rounded-sculpted looking black one with an arc of little buttons over its tuning knob. (Owzat for a technical description?)

> (The recent

Ooooooops! I use those things a lot. I'm off to check into this now.

It might just be the through-hole versions going, leaving the SD540x SMT versions. A lot of semiconductor manufacturers seem to be ditching their legged packages.

Cheers

Hello All,

I live in a very old part of town, houses are 100+ years old. I'm not sure if that has anything to do with my problem but still. I cause TVI.. I have my Rig turned down to 2.5 watts running into a 15 Meter dipole with swr 1.1 to 1... But still on CW it pulls the picture from my TV, and everyone around me. SSB I can't even use because it destorys everything...
I don't have a low pass filter, looking for advice on which one I should get, I may or may not need to work on my ground (would that affect TVI?), I can want to use a tuner so I can have multi bands on one dipole, hope to use a 40 meter dipole for 40-10...I never plan on running more than 5 watts out...
Radio is a TenTec Argo 556, powered by a Pyramid Phase III 12 Amp Power supply, Tuner is a MFJ 949C, but I cause TVI with out the tuner in line...
I live in an area that is filled with InterMod on vhf, I have all the tv, radio, pager, wireless cable, business band and whatever is radio, towers within a mile of my house.
I have to fix it on my end, the people that live around me 100% will not do anything to their end, they say if I don't transmit they don't get the TVI, which I'm okay with that once I'm 100% sure I'm doing everything I can on my end....

Thanks for any advice...

73,

Jim -- KC4SMH

A low pass on your output couldn't hurt. They don't rely on ground, so that's not a problem.

Is it on specific channels only, or many? I'm wondering wether you have a problem in the rig outputting excessive harmonics, or something else is going on.

You want that lowpass to start rolling off above the highest freq you will use, but it won't help a lot on low VHF channels. They are rated with a cutoff freq (3dB down) and some number of dB per octave.. Say your cutoff is 30 MHz, ok, at that point, the output is attenuated 3dB. At 15 MHz, we might expect 1.5dB(!) At 60 MHz we look at the rolloff number, maybe 12dB, so we would expect 15dB attenuation (3 at cutoff, + 12). So in the low VHF you don't get a lot of help from a lowpass.

Once you get up to 180 or so, we are 6 octaves out, and you are getting 63 dB+ (hopefully) attenuation, and some real benifits.

For problems in low VHF (cable converter outputs are on ch 3 or ch 4) then you can hopefully trap it out with a series resonant notch filter, or shorted coax stub. This is a piece of coax 1/4 wavelength at the interfering freq, multiplied by the coax velocity factor, usually .66, "tee" connected to the line, and open on the end. They aren't very broadbanded, so cut long, and tweak it down.

Series resonant LC traps are smaller, but maybe harder for you to get parts for.

A ferrite on your feedline at the transmitter end, and another on the antenna end may help too, trying to keep any energy off the shield.

Good luck!

Hi K5KNE:

"Receiver construction is not very common these days... Good Luck."

Boy, you are wrong there. Receiver construction has never been more popular than now, based on my 42 years of ham radio experience. The excellent and simple designs by Campbell (R2 Receiver, Jan 93 QST) and many other later articles (QEX, QST) dealing with image-cancelling direct conversion receivers, DSP, and DDS local oscillators illustrate this activity.
I built an "R2" image cancelling design, and use an Analog Devices AD9850 DDS chip for the local oscillator, giving me DC-30MHz or so of coverage, depending on the RF phase shift network. I get 50 dB of opposite sideband rejection, 13 dB noise figure, 110 dB dynamic range, and beautiful audio from my R2. I cannot tell any difference, listening, between using a high-Q LC oscillator LO or the DDS chip through a LPF. The LC LO is a big as my fist, but the DDS LO chip is the size of my little fingernail, and more stable.
The latest article in QST dealing with DSP 'Back end' for this receiver illustrates how nifty and simple receivers are becoming. We are living in a golden age for ham radio homebrewing!
Anyone who is interested in useful building projects, should definitely play with these. It is a lot of fun, and, just listening, makes you wonder why you need that big expensive Japanese transceiver with the 47 knobs on the front panel. They both 'hear' essentially the same (actually, the DC receiver may be a bit better!). And homebrew XMTRS? Piece of cake. But, I am strictly a CW and FSK man, so XMTRS can be very simple indeed.

3574. 50 ohm diplexer for DC-receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-02 00:00:00 UTC
From: la8ak@krsand.no
Message-ID: <3524096f.18021892@news.sol.no>
Source record: 84339

I have been looking for a possible 50 ohm diplexer for terminating the mixer in direct conversion RX. One is shown in Radcom 4/98 page 61 (Technical topics/G3VA) constructed by ZS6BZP. It was described in Electronics World february 98, pp138-143.
It is used with a 74HC4066 mixer, but I don't understand why +2.5V is fed back to the mixer through the termination/diplexer. The mixer is biassed from the input with 2,5V, so any voltage difference between input/output DC may cause mixer inbalance? I would suppose that the dc output level is fed through from the input and need no fixed bias at the input, only a 10uF(tantalum) bypass capacitor for self biassing is needed at the output end.......?

At QRP power levels, I'd suspect interference through the power lines. Try transmitting into a dummy load. If you still get TVI, try a power line filter. Could you borrow another rig to try from your location? You might have some sort of major problem with your rig. The ARRL RFI book is great -- check it out. You might also subscribe to the RFI e-mail reflector. Ed Hare, the editor of the ARRL RFI book, is a regular contributor. Good luck -- here's the info on the reflector:

Source record: 84343

If you have never built a yagi or quad before, it is probably better to build two antennas and mount them on top of one another.

If the driven element is a folded dipole, use 300 ohm foam-core TV leadin or 52 ohm foam-core coax for a 1/2 w driven element. An antenna tuner/swr meter is desirable, but not necessary.

As for element spacing and length, I would suggest you use the calculations in the ARRL Antenna Handbook. You can fine-tune the driven and parasitic elements by making them slightly longer than calculated and trimming them to frequency. Generally, though, the calculations will be close enough to give you satisfactory forward gain and F/B ratio.

The yagi can use aluminum rods, though larger diameter tubing will give better bamdwidth. Boom mounting hardware and boom mount for the driven element can be scrapped from an old TV antenna, In fact, if you have access to several old TV yagi's you can build antennas for either band from the scrap.

Suggestion
1st: Go to your local ham radio store and buy the best low pass filer
then have. Unfortunately, price defines quality. You want as many
filter sections, the the filter, as you can get.
Connect filter as close to transmitter/transceiver as possible.

2nd: Try staying away from hf bands of which their harmonics lie in
the channel used by your local cable company to feed your tv set, eg
channel 3 or 4.

3rd: If the interference is getting into your cable system, before the
cable converter, the problem could be in the cable system, then it
'may' be the cable companies fault. Don't jump on their tail untill
you can prove, and demonstrate, that one.

Hi Jim, Can you be a little more specific on the interference? What does it look like on the tv? What channels does it come in on? Are the sets on cable or receiving off the air broadcasts? Do you have a dummy load? If so, what happens when you use it? Do you still get into the televisions? Lots of good advise so far but I would suggest you try to narrow it down to a specific cause before you try the shotgun approach.

Thanks, that seems obvious in hindsight.

That still leaves me with the problem of getting quadrature outputs from the PLL L.O.

I'm hazy on this and don't have my reference books handy - if I were to generate quadrature outputs at say 60 to 90 MHz and mix them down to baseband, would they still be in phase quadrature? My intuition says not, but my intuition is pretty worthless when it comes to analytic signals :-)

Generating quadrature outputs at 60 to 90 MHz sounds easy - just run the PLL from 240 to 360 MHz and divide by four using some low propagation delay ECLips flip-flops. Add some gates to decode the counter and - voila - quadrature output.

On another note - given a direct-conversion DSP receiver with I and Q inputs, wouldn't it be possible to do the fine tuning (say within 1 kHz) at baseband in the DSP by multiplying the signal by a low frequency numerically-controlled oscillator and doing the image-reject mixer trick again? Then we could have coarse tuning steps in the PLL, and do the fine tuning in the DSP. (I recall that Watkins-Johnson does this in their DSP IF processing - I think their synthesizer only does 100 Hz steps, and the 1 Hz step fine tuning is done in the IF.)

There was an article in QEX several years ago on DSP audio filtering where the fellow did this trick on an Analog Device SHARC EZ-LITE boards as well as implementing the standard LMS adaptive line enhancer and Weiner denoisers. I guess he used it to get 1 Hz tuning steps on his rig. His design tacked on to the audio output of a standard receiver, so he had to use a Hilbert transformer to get an analytic signal. The R-2 D-C receiver design already gives us an analytic version of the signal.

This seems like it should work, but there's a small problem due to the fact that the commonly-available audio A/D's all have a high-pass filter down at the bottom of the audio range (say 20 Hz for thought-experiment purposes). When the D-C receiver is tuned right to the carrier, that's no problem, but if we start frequency shifting, we'll move that 40 Hz notch into one or the other sidebands. In practice, that narrow a notch might not be noticeable. Hmm, maybe it's an advantage

- one could use it as a built-in notch-filter for killing heterodynes.

Well, for the record: I ended up buying a "beeper case" in a local uniform
shop. It was made by "Duty Man" and is a black utility case used by law
enforcement to carry beepers. I have used it and it works well for what I
wanted. Best of all, it protects the battery from the elements and is hand
to clip on to any belt. Thanks for the ideas.

There was an article in the September 1969 issue of QST "A Direct-Conversion SSB Receiver" (it was also reprinted in the fifth edition of "Single Sideband for the Radio Amateur". It was about a direct conversion phasing receiver, using hot carrier mixers. He ends it with a bit about broadbanding, and shows a block diagram for a circuit that has a VFO feeding two mixers. The other inputs to the mixer are fed from a crystal oscillator; but the inputs are actually 90 degrees apart thanks to a phase shift network between them and the oscillator. The outputs of the mixers go through low pass filters, and you have to signals 90 degrees apart.

I'm sure I've seen this sort of block diagram elsehwere, but I don't recall ever seeing an actual project that did this.

http://www.minicircuits.com may have what you need, although most of
their mixers are only specified for IF outputs to 1 GHz. At some cost
in dynamic range, you can often get away with switching the IF and RF
ports to obtain RF coverage down to DC and IF coverage up to the full RF
spec.

Really, the best source for parts for a homebrew spectrum analyzer is...
a junked spectrum analyzer. If you can find an old HP 141T plug-in
with its mixer, attenuator, and/or LO intact, your most expensive
problems will be behind you.

Ever seen a field strength meter that was just a meter movement, diode and
antenna? I have. Instead of using that power to swing a meter needle why not
operate a radio from it??? Sure audio level would be a problem in all but the
strongest fields but if you happen to have one of those CBers next door with a
"16 pill amp" and a good enough antenna you could run a '390...

I have an old Radio Shack DX-150B which works great but it isn't very sensitive at the higher frequencies.

I'd like to add a preamp for 28 Mhz. Much to my surprise, the newest edition of the ARRL Handbook doesn't have such a circuit. Neither does Solid State Design.

Can anyone point me to a resource for such a circuit?

The AM is a bit of a "red herring." That is, the modulation on the
signal doesn't necessarily determine how you locate its direction.
A "Doppler" system or a directional antenna will work fine at
this frequency. Just look at what's done on 146MHz and scale it to
243MHz. It becomes smaller by the ratio of the frequencies, which
is rather nice. (Warning: practice can be quite helpful in
figuring out what your readings are actually trying to tell you.)

As is appropriate. Purism and vitriol rarely can drive only niche, not
mass, markets--as you know.

My late uncle, the first holder of this callsign (I'm the second), had a
saying: "You don't need a ham ticket to build stuff. Your FCC license is
for *operating*." Myths and legends about what's "real ham radio"
notwithstanding--one very hoary one being that "real hams" build their
equipment and don't buy it--my uncle's observation is absolutely true:
Your license operates as a legal instrument--that is, you are a radio
amateur--*only* when you operate a transmitter emitting RF in an amateur
band. Whether you designed the process by which the transmitter's ICs
were fabricated, put the thing together from a kit like Legos or bought
it from Ham Radio Outlet, is immaterial. From a regulatory standpoint,

closing the transmit switch is all that makes you a ham.

Building *is* special in the sense that relatively few people do it in any hobby pursuit. But the specialness of buidling only conveys so much, because *anyone*, at least in this country, is free to build whatever marvelous or lame radioelectronic circuitry, including radio equipment covering whatever frequency, they want. No license required! Why, you can even design and implement communications satellites and GSM gear and deep-space communication links without holding a ham license. It makes you wonder.

The only thing that seems downright repulsive about ham-radio building--and I'm sure it's only an illusion--is that many of its relatively few visible adherents seem to need to denigrate non-builders, in public, as a form of self-congratulation. I hope that they are part of a vocal minority, because very many very good non-building people enjoy ham radio, and because a hobby is supposed to be *fun*.

Is good! (Hi, David!) I think that would be the AOR-7030, which I hope
to get a listen to someday because I'm hooked on heterodyne SWBC
reception, especially with good sync detection (something the 7030
apparently has).

The SD500x info arrived via a comment made by a coworker in a position
to know. I find corroboration, albeit indirect, in the fact that Tech
America, the Tandy Corp in parts-supply-house dress, listed the SD5000
and 5001 for something like $2.50 per in a recent catalog--along with
MRF586s and other fine, but (as you put it so nicely) legged RF devices.

Hello to all, I have a number of brand new 12 volt relays for sale. Their brand new in the box, with 2 contacts that can handle easily 22 amps at 12 volts dc. I have used these relays for antenna switching up to 30 Mhz and 200 watts with no problem. They are also very handy for DC power applications. The price is just $ 3.00 per relay, with a discount if a person takes 3 or more. please email me for additional information.

> A pencil lead makes a dandy and less fussy cat's whisker for a razor blade...

Wasn't this also known as a foxhole radio? apparently got its name from
where it was used. The coil could be wound on a toilet paper roll with
the magnent wire from one of the headsets, second headphone to listen.

The pencil lead was fastened to a bent safety pin with heavy wire. All
components would fit on a small wood base. Push pins functioned as
fahnstock clips / binding posts.

The pencil lead and razor blade form an effective, sensitive detector
that is not overly critical to adjust.

Hehehe.... should I even know these things since I'm just 34 yrs old?

Just a note about the following: Some years ago I suggested that someone organize a receiver design contest/measurement forum at Dayton. A forum room for discussion and a evening measuring session much like that done at the VHF meetings. Given about a year lead time and some publicity, I thought it could be the equivalent of Robot Wars or such, fun and educational. Both people at the league and some heavy hitter authors on RX design quickly threw out the idea because subscriptions for QEX are minimal and "nobody builds anymore". Don, I wish your comment was true. But several years ago at Dayton after the DX session, there was a massive crowd at a presentation of a Japanese RX using DSP, although the DX crowd was its usual rowdy, noisy self and more people were talking than listening.

Hi K5KNE:

"Receiver construction is not very common these days... Good Luck."

Boy, you are wrong there. Receiver construction has never been more popular than now, based on my 42 years of ham radio experience.

3610. DIY PCBs

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-03 00:00:00 UTC
From: Russell Shaw <russell@martin.com.au>
Message-ID: <35254112.3835@martin.com.au>
Source record: 84347

Greetings all,

I thought I would share some ideas on PCB prototyping I have done. I have made my first 2-sided PCB using the photographic method. The minimum track width I used was 20mil (0.5mm) and the resolution seemed good although I got some shorts between closely spaced pads (are you meant to remove the clear plastic coating off the PCB *before* exposing?). I used Protel 3.1 (Grrr, etc) to generate a Gerber output, then used Camcad Graphic to read in the Gerber file so I could invert the image (I am using negative PCB emulsion) before printing it out.

Central to this method is being able to get a sharp, high-contrast printout onto a transparency. After some investigating and testing, I chose an Epson Stylus 400 ink-jet printer and printed onto Epson transparency slides ($3 each tho). I used black ink only and selected 720dpi in the driver (even tho 720dpi is labelled for photo-quality paper). The printout was excellent with sharp lines (at 1:1 scaling) and solid black. I used the negative process because large copper planes are printed out clear thus saving ink. I think the resolution would be easily adequate for tracks of 10mil. Another advantage of the negative process is that if the board gets overexposed, thin tracks will get thicker instead of breaking up into thin segments.

I mirrored the top layer printout so that the ink would be closest to the copper when exposed. For alignment, I placed both films together and matched the tracks, then drilled a 0.5mm hole thru selected large pads on both films, at opposite corners of the sheets. Then in the dark area, I placed the top film on the PCB, and drilled thru the film holes thru the PCB. I then removed the top film and got the bottom film and put it on the UV lightbox. Then placed PCB on it and aligned it looking thru the holes in the PCB to the holes in the film. Then black plastic was placed on top to prevent the top layer being exposed. Then the lid was clamped down and exposure was 3 minutes (my lightbox needs preheating for 15 minutes before use). I then did the same for the other side. After exposure, you can see the film pattern on the PCB even before developing.

Now the PCB was stuck in the developer (NaOH?) dish and brushed with a paint-brush to dissolve the unexposed resist. Then the PCB was stuck in the bubble-etcher tank to etch all that is unwanted (using ferric chloride). Some stubborn areas would not go, and I realised that there was still some undesolved resist, so I washed the PCB and brushed over it with more developer (after 2 hours etching!). After more etching, these areas were quickly removed. Then the PCB was washed, dried, and brushed over with stripper (at 50degC) which quickly removed all the remaining resist. Finally, the PCB was drilled. It is most useful (and probably essential) that you use a drill stand for your small PCB drill.

I think the next time round I could probably make the PCB in 2 hours total (it was 4"x6" and had 200+ holes). A real dark room isn't really needed, just some fairly darkish areas lit with non UV sources. I used a yellow 60W "bug globe"; the theory being that bugs can see the shorter wavelength light which these globes avoid.

Some PCB fab places will sell you the PCB cut to the size you want, and cheaper than most retail outfits.

Hope this helps...

Are there any caveats regarding the use of computer "switching"
power supplies for communications gear? Their high current
capability is very attractive, and they're readily available
in the EE and CS departments' dumpsters...

I'm running two of them in series for a 12v 10amp supply (both were
originally set at 5v each - adjusting the internal 20-turn pot
brought each up to 6v).

All you need is an adaptor that brings the AD9850 leads out to wider
spaced pads. You can then use ordinary groundplane prototype
construction for the rest of the circuit.

Source record: 84235

Hi,

I'm building a spectrum analyzer which should have a dynamic range > 70 dB.

Does it make sense to reduce the VCO's harmonics (f2 is - 20 dBc worst case with the POS 765)) e.g. using a lowpass between VCO and mixer?

The mixer's nominal LO power is 7 dBm (Mini Circuits SRA 5). The VCO's output power varies from 6 dBm to 10 dBm (without the low pass). Will this affect the mixer performance considerably? Should I add an amplitude stabilization circuit to get a constant LO power of 7 dBm?

Peter

3629. Frequency Hopping Homebrew

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-04 00:00:00 UTC
From: henryt@perth.dialix.com.au
Message-ID: <891701472.433882@newton.dialix.com.au>
Source record: 84246

Hi All,
I have recently been reading a little about amateur spread spectrum experiments. I have read an article where an amateur used some Icom IC-2A transceivers which had the frequency controlled by a C64. In this article (QST June 1986) it states that the experiment failed because the synthesiser never "locked up".

I wondered if anyone could point me towards a frequency hopping system that has proved successful from the amateur point of view. I am particularly interested in the frequency hopping rather than direct sequence systems. Is it possible to modify existing VHF/UHF gear to hop at reasonably fast rates?

Regards,
Henry.

Can any one help my find a schematic and parts for a old KDK FM 2030 2m rig. The main part I am looking for is a small RF transistor the only marking on are K74K1X. I think this is a FET but I am not sure. Can anyone help me.

Jan try the 12BH7A and if your rig has the BFO tube in series the
controlled heater warm-up characteristic of the 12BH7A will REALLY
stabilze the BFO as well...I used this with MY R-30 and it worked VERY
WELL ...I will try to find the Circuit component list ..I do remeber a
1k pot in the Cathode line to ground for balance... 73 de Jordan

>at reasonably fast rates?

In principle, you can modify anything to do anything, if you're willing to modify it enough. I'd note that TAPR is using dual NCOs to get a fast hop rate. They switch back and forth between them to hop. This gives the entire dwell time for the other one to settle to the new frequency. You could do something similar.

(It appears to me, though, that the switching itself produces a hard pair of spurious sidebands. If the spread bandwidth is less than the switch rate, you could clean that up with a bandpass filter. I'm not clear what TAPR is doing here, perhaps they are just ignoring the spurious sidebands. Seems to me that would hurt receive Eb/No. Perhaps not. It may just add a DS component to the FH.)

You should be able to do a slow hopper directly with one DDS, but you'd have to sacrifice clean operation in order to get the transition time down to avoid gapping. In other words, you couldn't run a clean up PLL after it because you couldn't get the slew rates of two different PLLs to match exactly. That would be dirty, and probably wouldn't meet FCC spurious emission limits (though I'm not exactly sure how they apply to a SS rig). Of more concern, it would be dirty on receive, and that would hurt recovered Eb/No.

If you allow gapping in order to let the loop settle, you can run a clean up PLL, but you can't use analog modulation. You could synchronize a digital modulation with the hops so that you could have gapping without harm, IE one hop per bit. That'd eliminate frequency diversity gain for the bits, though.

Direct sequence is much easier, of course. You can convert virtually any VHF/UHF ham rig to DS with the addition of a mixer and a PN source. There are no settling issues because the PLL remains on the center frequency (or can be modulated analog in conventional

FM manner). As I recall, this approach was written up in the Spread Spectrum Sourcebook.

Lot of 10 NEW 14 volt grain of wheat light bulbs. Most rigs use 12
volters. These are 14 volters and put out just about the same amount
of light on 12 volts as the 12 volters do. They should last virtually
forever once replaced in your rig. This voltage is quite hard to find.
Mostly one ends up using 12 volters only to have to replace them again
in a short time. These bulbs draw apprx. 60ma. at 12 volts. I found
these at Dayton one year and bought up all the guy had. Lot of 10
grain of wheat bulbs $15 postage paid to you.
Email me if interested. Also have some of these up on eBay if you want
to play the auction bidding game.

This question is answered best by geometry. If the wavelength is small enough, then the focal point is just that - a point. Consider first that the dish were the parapet of an open umbrella. The focal point will lie along the shaft of the umbrella. So where along that line is the focal point? Take a long broomstick and steady it in the parabolic dish such that it is like the umbrella shaft. Make sure it does not lean to any particular side, but that it is perfectly symmetrical with the parabolic dish (use equidistant strings to the bowl edge.) Now take a piece of electrical tape and run it along the inner surface of the dish from its center to some point on the edge of the bowl (as though if the dish were facing the sky's zenith and the sun were out, it would cast a shadow by the broomstick onto the dish such that it would look like the electrical tape at some distict time of day.) Set the dish such that it is pointed at the true zenith by using a level (ie with bubbles), the dish being correctly pointed when the direction of the symmetrical broomstick is perfectly vertical (as read by the level.) With the dish and broomstick steady in an upright position, consider some horizontal line in space between the electrical tape and the broomstick (the level bubble for horizontal would be perfecty centered if held along this imaginary line.) The correct horizontal line is the one which has the following property: The horizontally level distance from the point on the broomstick to the electrical tape is exctly twice the distance from that point on the broomstick to the base of the broomstick (which connects to the dish.) That point on the broomstick is the focal point.

>You could use some Minicircuits MAR-6 amps about $1.16 each.

I have used the MAR-6 as a preamplifier for a tuned loop antenna with good results. However, when fed directly with a wire antenna, the output is full of spurious responses (which is expected with an IP3 specification of only +15 dBm). This amplifier has considerable gain from 0 to 2000 MHz, so all MF, HF, FM-VHF and TV broadcasts and cellular phone signals will also be amplified by 15 to 20 dB.

Some form of selectivity is definitely required in front of the MAR-6 to keep out the strong broadcast signals.

Well then, it does matter - put the dish in the backyard, so all that
sloshing around does not mess the house up. Yes, the backyard is where
the cats dish should go.

But will the performance of the cat, and of the dish, be affected by the
weather? What about storms? Will Kitty starve?

It just occured to me that if you replaced the lead pencil with a Bic pen, you would have receiver that worked underwater?

Now, to complete the totally powerless (and probably useless) QRP rig, you could excite a slab of piezo electric material with a diaphram hooked acorss an LC circuit. Sound vibrating the crystal would generate harmonics for both 75 and 40!

Seriously, has any work any been done on a wind operated transmitter as was used in the movie ET?

4/4

For Sale:

Ampex Amps/ Dynaco SCA-35/ Fisher 500-B/ Fisher X-101/
Fisher 90-T/ Heath AA-141 + Tubes

Ampex mono amps (pair)

These were converted from integrated amps to mono basic amps.
6v6 output tubes. Rebuilt with new caps, new resistors, new power
supply, gold RCA output jacks and detachable AC cords. Grey face with
grey knobs. Very small units. Both work and sound great!

Copy of Ampex brochure describing these units (with schematic) included
as well.

$150.00 + shipping

Dynaco SCA-35

Good working condition. Some smudging of lettering on face.
Good quad of GE 6bq5 output tubes.
Includes copy of schematic and my personal notes.

$145.00 + shipping

Fisher 500-B

In good working condition. With nice case and copy of schematic.
Knobs all match but are not original. Previous owner's name scratched
lightly onto face, otherwise very clean.

Copy of 500c manual, service instructions, and my personal notes
included. Note there is very little difference between the B and C
versions.

$200.00 + shipping

Fisher X-101

Rebuilt power supply/ new quad cap.
This unit is ready to play.
With good quad of 7189 tubes and good 12ax7 tubes.
Overall very good cosmetic condition.
No case.

$160.00 + shipping

Fisher 90-T

This is a tuner preamp. AM-FM with full source selection and tone
controls. Unit is mono, tuner section has MPX out for stereo connection
to an external MPX unit. Preamp section has main out and tape out.
Tape out, bypasses the tone/ volume controls and the extranious switches
for a cleaner sound. Tuner section is very sensitive in both AM and FM
and is in good alignment. Tuning eye tube in good condition. Cosmeticly
clean chassis, Brass face has a few scratches. Overall VG condtion.
No case.

$80.00 + shipping.

Heath AA-141 Preamp

The unit is clean and in good working condition.
Includes full compliment of 6eu7 tubes.
Includes copy of manual for 141a.
Replacement on-off switch.

Sounds great and alot better than a stock Dyna PAS!

Styling is just like the AA-100 integrated.

$125.00 + shipping

Tubes for Sale:

Metal 6V6 used

4- RCA

$10.00 + shipping for all 4

Well, Henry, I don't use multilayer boards for SMD construction, or
for strip lines (though I only use the latter at UHF). Plain old double
sided board works just fine. I'm not shooting for the maximum in
component density. And because the parts are SMD, I don't need
to drill so many holes.

The *only* real issue is being able to etch lines and pads fine enough
for the SMD parts. But that's mainly the problem of the litho shop that
makes my transparencies, and proper control of the etching bath
temperature. I can afford to waste some board stock getting one just
right. I'm not doing production, just one off prototypes, and board
stock is cheap.

Remember that a PLL VCO will be in quadrature with its reference when locked.
So just use a second VCO locked 1:1 to the first and you have your quadrature
outputs.

As long as they're mixed with the same phase of the mixdown oscillator, sure
they're still in quadrature.

No need to do that. You can do it all in software on the DSP. Just offset the
main tuning about 10 kHz to get the signal away from zero and do the rest
in software.

3651. Kenwood TM-V7E as I2C slave (remote control)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-05 00:00:00 UTC
From: marc@aargh.mayn.de
Message-ID: <ffG6C*o6i@aargh.mayn.de>
Source record: 84268
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.equipment

I've programmed a 20 pin AVR microcontroller to act as 100khz I2C slave. When properly interfaced to the LCD connector of the V7, it can simulate key presses.

Reading the I2C slave (similar to reading a serial EEPROM) reveals the current LCD contents (frequency and so on).

Writing commands to it simluates the LCD keys.

The LCD can _not_ be connected to the V7 at the same time as the remote controller (without more development). The connectors are non-standard, the easiest (=expensive) way to get them is to buy an LCD extension cord.

I'm not sure how (=whether) to go on with the project, now that the interesting part has been done. Are you interested in my work?

Most radios. e.g. Yaesu FT 212,2400,2500 etc.,etc. use a 10 volt bulb which Yaesu wants to sell you for lots of bucks and then it blows out again just like you surmised. I replaced these with Radio Shack 12 volt bulbs at 2 for $1.79 and haven't had to re replace any yet. Yaesu and maybe others run these off of a 8 or 10 volt regulator and not directly off of the 12 volts that the radio runs on.
At any rate, whats so rare about a 14 volt grain of wheater? American Science and Surplus has them for 4 for $2.00 or 50 cents apiece. The $1.50 each price you are quoting sounds like a rip off.

>That still leaves me with the problem of getting quadrature outputs from the PLL
>L.O.

No problem. You don't need them if you have the xtal osc providing I
and Q o/p. Now of course, you need TWO mixers but these are pretty
cheap at these freqs. - and TWO LPFs which have to be matched of
course. That's not so hard either. I made a pair of 200 MHz 3 pole
LPFs that matched within a few degrees at 200 MHz - just by careful
component selection and coil winding.
These BTW were for a 1 GHz I-Q downconverter which worked rather
well.

>Thanks, that seems obvious in hindsight.

>That still leaves me with the problem of getting quadrature outputs from the PLL
>L.O.

What about using a single PLL VCO (60 - 90 MHz) and
instead splitting the xtal oscillator signal (60 MHz) into paths and
run one half through a quadrature network and mix the outputs
separately in separate mixers with the single PLL VCO signal.

This way you will get two HF signals in quadrature in the HF band
after low pass filtering of both paths. A passive quadrature network
for a single spot frequency (60 MHz) should be easy to construct and
align.

3656. HELP!!! with IC-251A

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-05 00:00:00 UTC
From: "Matthew S. Mayfield" <msmay@ricochet.net>
Message-ID: <3527467C.51AFC2B0@ricochet.net>
Source record: 84273

I have a ICOM-251A 2-meter all mode. The RIT stopped working. When I would depress the RIT switch the RIT light would come on, but would not stay on unless I held the button down. After studying the schematic I found that the RIT was engaged via a D flip-flop. (NEC D4013C) So I decided I would change that IC. After changing the IC the RIT worked like it was supposed too. But it also created another problem. The radio now tunes in (FM mode) 15kc where it is supposed to tune in 5kc steps and with the Tuning Step engaged it tunes in 3kc steps it should be 1kc. The chip I replaced it with was a Motorola MC14013B. Is there a difference between a 4013C and a 4013B???? I have checked all the header plugs I removed to change the chip they all look correct. Help!?!?!? this is driving me crazy.

Hi Group,

I am trying to get up and going, the MC13176D demo board from motorola. This is a UHF transmitter board. My target frequency of operation is 456MHz. However the board frequency is 320Mhz. My goal for 456 Mhz is to use this tranmsitter as a low power paging transmitter. with about 5dBm, I should get coverage around the house.

Right now, I am just trying to get up and going on 320Mhz. The application notes are not very well written so I am having to figure out what is going on. At last try, I have not been able to get it up and running.

Has anyone used this component or fabricated the demo board?

Thanks!

Paul

3661. Designing XTAL Oscillators

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-05 00:00:00 UTC
From: Robin Birch <robin@falstaf.demon.co.uk>
Message-ID: <N1t0dBANn2J1Ewnd@falstaf.demon.co.uk>
Source record: 84278
Cross-posted to: uk.radio.amateur,rec.radio.amateur.homebrew

Dear All,
I am designing my first homebrew transmitter. I have opted to use a 5 - 5.5MHz VFO with a harmonic mixer and a crystal oscillator. I have a design for the mixer and the VFO I am now looking at the XTAL Osc.

A couple of questions:

1) When looking at oscillator designs there are two families, depending on whether the xtal is driven in a series or parallel mode. What are the merits/demerits of each approach.

2) I have never specified xtals before, do I state the mode of oscillation and the frequency or what?.

3) Also the books refer to oscillation taking place at frequencies slightly lower than the parallel or series modes.. If so, and given that the final frequency is what I am after. Do I give the mode and desired frequency or the nominal frequency of the xtal?. E.g., do I say:

serial resonance 5.001MHz or serial resonance and 5.00 MHz given that my final frequency is 5.00MHz.

4) Previously when buying xtals I've just given a frequency and the type, not the characteristics E.g., x MHz for a Pye Westminster. Can someone give me some contacts of companies who will cut to my spec or, as the ones that I am looking for are whole numbers e.g., 7MHz, 9MHz, 12MHz and so on, are there suppliers who make standard ranges?.

The oscillator that I want to make will have three or four switched ranges in the 7 - 12 MHz region. Will have to be relatively stable, I am not resorting to ovens etc, just the best I can do with good components and a reasonable deign.

Thanks in advance

Robin

I have some nice RCA 813 NOS in stock. This is a great valve with a 125 Watt dissipation and directly heated. You can run 2200 V on the anode and 750V on G2 and get nearly half a kilowatt output from two of these in push-pull. Or you can triodeconnect them with at least 1000V to the anode and G2 (watch the G2 current!)

Also a lot of other nice high power transmitting valves in stock.

Best regards,

Arnold Goks&#65533;yr

3668. Unusual DC receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-05 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <3527ec78.0@newshost.pcug.org.au>
Source record: 84285

I've just built an unusual DC receiver that I feel will have a lot of appeal.

It uses an FM broadcast receiver as an audio amp. Audio is fed in via a cheap FM wireless microphone kit. All the receiver consists of is a two-diode product detector and a tunable local oscillator on 3.5 MHz. By adjusting the front end values, either 40 or 80m signals can be heard.

It's very simple - just one transistor for the local osc and two diodes for the product detector along with the wireless microphone kit. Most gain is in the FM receiver. Any local oscillator and detector combination should work for this project.

There are many uses for this rx, whose output can be received on any FM radio. Use the graphic equaliser in your stereo to adjust selectivity, or listen to amateurs when working on your car by tuning in on the car radio. Or use a walkman to listen when in the garden.

It's still a prototype at the moment, but performance is so promising I thought it was worth a mention.

Sorry, no schematic or other details available, but you should be able to build one from the details given above.

73,

Peter VK1PK

The correct connector is Belden part number 82-202-1006

They make several other N connectors for RG-213, RG-8/U etc that are
poor fits for 9913.

These are neat toys, but applying them incorrectly can cause *lots*
of trouble.

My favourite setup is to use one of MAR-3, MAR-6, MAV-11 or ERA-1/2/3
(depending on frequency, gain, noise figure, dynamic range, etc.),
with bandpass filtering on either side. Do yourself a favour and run
the MMICs from a regulated supply. I stock 78L08s (TO-92 and SOT-223
packages) for this purpose.

> driven by center and the other attached to braid (like a dipole)...

No, you can't really do this because the parasitic elements drive the
driven element impedance well below 50 ohms. Also, the unbalanced
coaxial cable connection to a balanced driven element will result in
unbalanced current distribution on the driven element. The effect of
this will be a "skewed" pattern - i.e., the "durn thing" won't have
maximum signal where you think you are pointing it.
>
> 2. ...or must it be a single section with a clever slider for gamma match?
>
The gamma match solves two problems - impedance matching and balanced
current distribution. A gamma match essentially reaches out on the
driven element to find the 50 ohm complex impedance point. The series
capacitor tunes out the reactive component so you see 50 ohms resistive
at the feed point/cable connection. Using this method, you can bolt the
one-piece driven element to the grounded boom, since the impedance at
the center of the half-wavelength driven element theoretically passes
through zero at that point. Since you are feeding it off-center,
current distribution forces itself toward a balanced condition.

A "T" or Delta match does essentially the same thing - being a "double
gamma" in effect. However, you must use a balun of some sort to match
the unbalanced coaxial cable to the balanced antenna feed.

> 3. May the braid be attatched to the beam when the above method is used?

In the case of the gamma match, yes. In the case of the other methods
of matching - generally the coaxial cable braid goes to ground while a
transformer-type matching handles the current phase relationship.

Hi Laura,

Which flavor of hams do you meet and talk with? Do they work strictly SSB on HF? 2M FM? or "digital modes" on any band? All three of these areas are notable for a lack of technical knowledge amongst the operators. When you work CW, especially QRP CW, you will run into the homebrewers.
The R2 is far from a "complex" circuit to build. After all, it is almost all audio! (Have YOU looked at the circuit diagram?). And a PC board is available. Just compare this to the complexity of a superhet such as homebrewers built in the 50's and 60's. Then as now, there has always been only a small minority of homebrewers, especially building receivers.
Amongst those I work on the air who never tinker with circuits, I always get the opinion that "it is impossible today because you cannot get the parts", or "it is far too complex to build anything". Nothing new here; that group in ham radio has always had that opinion.

Hi Jeff OM,

Most of the newer transceivers all have switching power supplies, especially the ones using MOSFETS in the final amp. A well designed DC supply should work with any communications gear. Just be sure the design is well done (excludes many "consumer-quality" supplies), so the radiated and conducted EMI from the supply is well-suppressed. I use a surplus switcher to run my hb CW and FSK transmitter.

Brian OM,
Have you looked in ANY ARRL Antenna Book of the past 4 decades? They all contain design information for up to 3 element yagis.
Forget about finding all the answers laid out for you by someone else on the internet, and instead so some reading-up in good books. It will save you time in the end, because you will know what you are doing, and why, and you will be able to recognize when the result is working properly.

Hello D,

Have you looked in any ARRL antenna book for details on yagis? Your
post seems to imply you have not done much study of existing literature
on yagis.
In short, you can configure the driven element any way you want:
split dipole, folded dipole, solid dipole with gamma match, or tee
match,
etc. Successful yagis have been made with all of these kinds of driven
elements. Any antenna book illustrates this.

I am in the process of building a homebrew yagi out of copper tubing and an aluminum beam.

I have a few questions about the driven element.

1. Can the driven element be either two seperate end to end sections one driven by center and the other attached to braid (like a dipole)...

2. ...or must it be a single section with a clever slider for gamma match?

3. May the braid be attatched to the beam when the above method is used?

Thanks! Please reply to groups as well as mail- things have been silly here lately.

Unless you closely duplicate the 40-year-old oscillator circuit, the rock
is unlikely to oscillate precisely at its marked frequency anyway. I'd
build a little tweakability into the oscillator circuit and zero a harmonic
of it with WWV. Then the answer is "yes".

>driven by center and the other attached to braid (like a dipole)...

Yes you bet it can. The element must be insulated from the boom of course.
There is a drawback to this sort of driven element, however. The feed impedance
of the driven element in a yagi will rarely be 50 ohms (almost never). That's
because the coupling of the parasitic elements loads it. You can deal with
that by using a matching stub, of course, but that dangles down around
the mast and can be a nuisance.

>2. ...or must it be a single section with a clever slider for gamma match?

A gamma or Tee match is better. This lets you DC ground the driven
element to the boom (good with respect to static drain and lightning
strike current mitigation). And it gives you an adjustment to achieve
a 50 ohm match to the element.

>3. May the braid be attatched to the beam when the above method is used?

I think you mean boom. The answer is yes, right at the point where the
driven element attaches to the boom for the gamma match. For the
Tee match, the braid goes to one leg of the Tee, the inner to the other.
Both are DC grounded to the boom of course, through the element.
(Actually, you should use a balun at the feedpoint. A 1:1 current
balun is fine, and still offers a DC connection to the boom.)

3693. AM Techniques for Solid State

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-07 00:00:00 UTC
From: Joe Bento <jwbento@mindspring.com>
Message-ID: <352ADD9A.388849B5@mindspring.com>
Source record: 84102

Hey all....

I've been thinking of building another HF AM transmitter, and this time I'd like it to be solid-state. Since high-level modulation offers the best performance, I'd like to design the final for class C and collector modulate (is that the proper term?) the final.

I work with solid-state transmitters and surface mount components on a daily basis with my job, but these are all FM. I know how to modulate a 6146 or a 807 for example, but how does one accomplish high-level modulation on a transistor? Since the devices generally require at least 12v at several amps, it seems to me the minimal resistance of the secondary of a transformer would introduce unacceptable loss in the collector source.

I'm considering using transistors such as MRF428A biased in a class C configuration. It would be run conservatively at about 100 watts. Achieving near 100 watts of audio for the modulation is easy enough with the monolithic devices available. But - how to couple this audio to the final RF stage? Any possible URL to study or book to review would be greatly appreciated.

Can somebody help? Running my DX-100 and Globe Scout on AM is fine, but I'm really curious to try and build something modern. Hopefully I won't have to resort to low-level modulation and run the amp linear. This defeats the goal of what I'm trying to do.

Thanks!

-Joe N6DGY

Those are hard to come by. Look up Plastic Capacitors, Inc. for a good
source of high-voltage oil-filled capacitors.

Remember to derate the voltage very conservatively, if you're going to
put them in series.

I guess what threw me was the part about "the *amplified* voice is
simply applied to the base..." With the circuit I described, the signal
from the mic does not need to be amplified before being applied to the
RF oscillator stage.

Modulating the Miller capacitance of a bipolar might be fine, but I
can't see it giving the same degree of sensitivity as a real varactor.
Even my cheesy "bug" circuit relied on running at > 1 GHz to ensure that
even the tiniest changes in capacitance would result in a substantial
frequency swing. In the FM band, you might well need a dedicated audio
amp stage even with a varactor, for good sensitivity.

I would suggest looking at the ARRL Handbook for Radio Amateurs. In the
1998 edition on pp 17.68 - 17.72 they describe a regenerative receiver
for beginners. It uses three transistors and an op-amp. They claim it
has good sensitivity and selectivity.

Ahhh, you hadda throw "reasonable cost" into it, which lets out building one. For the cost of building even a mediocre AM DX radio, you can get a GE Superadio III. Of course, if you're willing to spend more than that, you can build a pretty good AM radio.

Five or six years ago I saw one of those electronics magazines with plans for a six-band SW radio. The plans looked pretty good, and it was built on double-sided PC boards, but there was no PC plan! You had to free-hand it, and it looked far more difficult than I wanted to tackle. The author said it could be built for about $100 or so, but considering that it had limited coverage, I passed.

The driven element can be either a dipole or a single element. For construction stability a single element connected electrically to the boom and tuned with a gamma match is my preference because a gamma match can match a wide range of impedences and can be tuned to really get the SWR down to 1:1. If you choose to have a "hot" or isolated driven element, you must have a strong insulator to hold the driven element plus match the driven element to the coax, because it is not likely to be 50 ohms. Sometimes a "hairpin" or shorting loop is put across the feedpoint to create a match. A good device for seeing what you are doing when trying different matching combinations is a MFJ 259. Also, getting it tuned on the ground and then finding it has changed when you get it in the air is another fun variable. Email me if you have any further questions. Good Luck. Walter

The Antenna Handbook is one source of help. Also there are several other antenna books in ham stores. I visit Austin Amateur Radio (TX) and they usually have several antenna books.

A 17 meter beam is a project that I have been thinking about also. I plan to make it a 3 element yagi. I will probably use the formula for the driven element and add 5% for the reflector and cut 5% for the director. The spacing does make a difference. I will probably start off with about .15 wave to the reflector and .25 wave to the director. If you draw a blank on resources, email me and I will do some digging for you. Good Luck. Walter

What band are you building this yagi for?

I just built a 5-element 2M yagi by "recycling" a TV antenna, there was an article in QST a while back on doing so... The nice thing about this design was that it used an inductive coupling to the director element. Each half of the director was mounted to the boom with an original element mount/insulator (modified so the elements pointed straight instead of at an angle).. a length of RG-8X was shorted at the ends and fed in the middle to each half of the shield cable...

Works great, low swr... I bet this approach could also be used on other bands... nice part is that the tuning is easier because you can hopefully adjust the length of the coax before you have to start chopping the director (of course the director must be reasonably close to the proper length).

> You could do something similar.

Actually, TAPR is using dual VCOs, not NCOs (NCO = "numerically controlled oscillator", a pseudonym for DDS). The VCOs are part of a dual-PLL synthesizer, outlined in the PDF form of the DCC97 paper.

An NCO/DDS doesn't require any "settling time" - the change in frequency takes place in one clock and is phase-continuous.

Yes, you're right that the use of two independent (non-phase-coherent) oscillators will indeed result in a phase transient at the time of switching, but this is apparently only once every 10mS. Practically speaking, this won't significantly increase bandwidth, though a bandpass filter should be used to reduce any out-of-band content.

I live in a high-rise apt. building in NYC. As is usually the case, I can't mount anything outside.

Most of my scanning is done between 43.750-49.990, and in the 460.000-490.000 range. I can hide something outside the window, but it would have to be about 4ft long and 4 ft high.

Im new to building antennas but very good w/ soldering, and electronics.

I am currently using a RS Magnetic mount scanner ant. The base rests on an 18" metal ruler, sitting out on the window sill.

PLEASE !!!! let me know if there is a better way to monitor the airwaves.

Thanks for your help.

europa@primenet.com wrote:
>
> I laughed seeing this propaganda being dispensed as some sort of fact.

I don't think that it's propaganda, but I'm certain that it is some
sort of fact!

Illustration:
Several years ago, at the Magnum Centre rally in Scotland,
there was a brand new TS850 on the stand of a main dealer. The dealer
claimed that this was the first one in Scotland. There was a crowd
around it. The stand had no power, so the radio was not working, but
they were jostling to press the dead buttons and spin the lifeless knob.
Several people offered to buy the thing there and then, one I heard
offered a premium over the list price, just to get the first one. All
this for a radio that they'd never even seen powered up.

There is ample evidence that many of purchasers of store-bought amateur
radios make their choices based on features, bells and whistles. It is
very easy to assume that if you can't hear it, it isn't there, or that
"conditions" make it impossible. Often the assumption is right, but
sometimes a high performance receiver might just make the difference.

Lately there is the "I must have a radio with DSP" fashion that
neglects to question whether DSP implementations are yet fully
competitive with their analogue predecessors. One manufacturer has
mentioned 144dB dynamic range in an advertisement - evidently because of
using a 24 bit fixed-point processor - and seemed unaware of the
cumulative effects of repeated arithmetic of fixed precision, to say
nothing of the state of the art for Analogue to Digital conversion. Mind
you, there were enough manufacturers back in the analogue days that gave
the plots of their Xtal filters as the selectivity curves of their
radios, despite the fact that lack of screening to prevent signals
leaking around the filters, and LO phase noise meant that the radio
performance could never approach the filter performance.

> If such a receiver were expensive it would be due to the economics of
> lack-of-scale. Just like the rest of the world, mediocrity prevales in the

> exception would be high quality crystal filters which are pretty expensive.
>

An artful constructor could get around the problem of expensive crystal filters to some extent. Ladder structures of identical-frequency quartz elements get around the need for custom Quartz, and can be made with better intermod performance than some of even the very expensive commercially made block filters. Pochet, (Dishal), Hargreaves and Hayward have published design methodologies. Keeping Xtal filters at low frequencies, with bigger lumps of Quartz also seems to imptove TOI.

> I build my own receivers and use old tube equipment for the transmitter. I
> do have a nice TH79. Its the only store bought equipment I own. I have
> noticed that the receivers of the most top of the line xcvrs ($3k-5k) are
> getting a little better, but its unlikely I'll be spending any more money
> on QST advertisers in the near future.

It's no great task to homebrew a receiver with performance that cannot be matched by anything that cannot be bought. There have been advanced designs published for years. G2DAF then G3PDM in the 1960s were well ahead of the game. Makhinson and then Horrabin have published interesting things in the 1990s.

While I agree with Dave Newkirk, that the majority may have eschewed home construction, and buy radios like consumer goods, I think that there is still a small core of avant-garde adventurers pretty much like there has been since the beginning.

Were people who simply duplicated existing designs really that different to people who buy ready-duplicated radios? I don't want to confuse numbers with innovation.

Cheers
David GM4ZNX

(There's an IC765 in my shack. I rather like it. It gets used as a tool for developing other things, it's a useful comparison standard, and it's the one thing that remains useable when I periodically rip all the homebrew gear apart to start again ;-)

I've checked, and not found anything about obsoletions from any of the companies making the SD5000. I use these things a lot for work-type projects.

Home-type musings are in the ADC-DSP area. Maybe some decade I'll build something. By the way, I thoroughly enjoyed the recent QEX, and Emailed Bob to say so.

hello sir,

just use a 72 inch Radio shack whip antenna stuck into the top of the
scanner.

Using any thing connected with a rg58 coaxial cable really is much worse
as it almost filters out all the 400 MHZ and 800 MHZ signals.

Plus, an 72 Inch whip is close to a quarter wave at the 43-49 MHZ
frequecy band you are looking for.

have fun !!!

>
>A couple of questions:
>
>1) When looking at oscillator designs there are two families,
>depending on whether the xtal is driven in a series or parallel mode.
>What are the merits/demerits of each approach.
If the oscillator circuit is series resonant it will oscillate a
resistor of 50 ohms or so at nearly the crystal frequency. ie it is a
zero phase amplifier.
You may wish to pull the xtal higher or lower by 20 parts per million do
this by including a small inductance or large capacitance in series with
the crystal this will pull above or below series resonance.

>
>2) I have never specified xtals before, do I state the mode of
>oscillation and the frequency or what?.
If you use the above approach specify series resonance (will usually be
fundemental mode at this freq) and a tolerance on manufacture say
+-10ppm and a tolerance over the temp band say +-25ppm 0 to 60C
>
>3) Also the books refer to oscillation taking place at frequencies
>slightly lower than the parallel or series modes.. If so, and given that
>the final frequency is what I am after. Do I give the mode and desired
>frequency or the nominal frequency of the xtal?. E.g., do I say:

You may alternatively place a smaller value of capacitance in series
with the crysatl in the series res circuit say 30pF and then adjust the
freq +- 20ppm by varying the cap from 25pF to 40pF this specification
will then be (frequency you require) at 30Pf sometimes this is called
parallel resonant
>
>serial resonance 5.001MHz or serial resonance and 5.00 MHz given that my
>final frequency is 5.00MHz.
>

>as the ones that I am looking for are whole numbers e.g., 7MHz, 9MHz,

>12MHz and so on, are there suppliers who make standard ranges?.
Farnell maintains stocks of standard freq but tolerance is poor try C-
Mac Harlow for specials they now have a short delivery service.
>
>The oscillator that I want to make will have three or four switched
>ranges in the 7 - 12 MHz region. Will have to be relatively stable, I
>am not resorting to ovens etc, just the best I can do with good
>components and a reasonable deign.
Three parameters for stab; temp time and adjustment.
Use a local xtal manufacturer , specify a resistance weld crystal not
solder seal .
You may be able to get +- 7.5ppm 15 to 45C if you ask aging of 1ppm/year
should be possible.
Adjust to nominal freq at room temp yourseld.
overall stab per year should then be of the order of +-5ppm

>
>Thanks in advance

****

No. The VCO , which you are using as an LO, will switch the
diodes in the mixer as a GATING signal. In other words, the
LO will act like a square wave due to the conduction in the
diodes. It is not reasonable to clean it up to a sine wave
before application to the L O port of a mixer that is acting
as a switch unless there is some terrible high harmonic
content present, which is not usually the case.

In fact, driving the LO port with a square wave can give
significant advantages. Several application notes are using
LOGIC outputs (CMOS capable aof 20-30ma)as the L O buffer.\

I started doing this in my projects 20 years ago and it
simplifies a lot of things.

So, don't worry about VCO odd harmonics since they will be
re-created in the diodes of the mixer. Instead, concentrate
on a frequency scheme that takes advantage of the spurious
characteristics of your PARTICULAR mixer. MiniCkts furnishes
such material.

For example, if the mixer chart says that the 5 X 4 product is
bad, try to change your a frequency scheme to one where that product is
not
a factor. This is much harder than it sounds, sometimes, but
this is the way that advanced designs are done --- and the reason
for so many different frequency schemes.

Since your spectrum uses a known input range, and you probably are using an I F based on available filters (10.7, 16.2, 21.4 etc) you don't have this freedom. So you need to run a spur analysis and identify which spur pairs (3X2, 2X0, etc) are going to cause you problems. THEN try to find a mixer which has higher immunity to these pairs, such as by choosing a higher level mixer, etc.

Other than that, you just have to do the best you can. More than likely it will work pretty well, with one or two spurs you just have to live with (wink).

I would think that most of the gain would be in the wireless microphone
preamp. That's necessary to get enough deviation to work properly with
the FM broadcast receiver. (So be careful with this preamp.)

>There are many uses for this rx, whose output can be received on any FM
>radio. Use the graphic equaliser in your stereo to adjust selectivity,

But note that's not single signal selectivity, IE the detector is double sideband,
and any filtering at audio afterwards is still double sided. No biggie, that's
common to any DC receiver which isn't of the phasing (I/Q) type.

>or listen to amateurs when working on your car by tuning in on the car
>radio. Or use a walkman to listen when in the garden.

This is a cute idea for a very simple DC receiver. The notes I've added
may be helpful to someone looking for ways to optimize it a bit. In particular,
work on the wireless mic preamp would give the greatest rewards.

When the 10 watt RF power module (M57713) dies in the Trio/Kenwood
TR 9000, can it be replaced by the (considerably cheaper) M 57727
module which is rated at 25 watts?
If so, what circuit modifications are needed for 10 watt operation.
Does the drive just have to be reduced, or are changes necessary to
the protection and ALC circuitry.

Best Wishes
from Mike

>VE2SWL/VE6...

Please explain what makes 12BH7 much better than 12AT7/12AU7? In this RX
one half of 12AU7 is BFO and the opposite triode is detector, IF i/p on
grid, with decoupled emitter and small capacitor from BFO to grid of
detector. One suggestion is to connect the injection to the cathode, but
I suspect that this has low conversion gain, so I would rather connect
IF and BFO signals in series to the detector grid. I don't see any
important reason for using balanced detector. I once tried to improve
12AT7 balanced IF mixer in FL-dx-500/FL-200, but when balance was
improved the gain went down, so eventually I had to remove any
modifications and return the the old circuit.

Interestingly, much of the "gain" in this case would take place in a
part with only two leads -- the varicap diode in the wireless mike. A
true parametric amplifier.

I once amused myself on a weekend afternoon by trying to build the
smallest RF "bug" possible. I used a one-transistor VCO at around 1.3

GHz, with a (very) capacitance-dominant resonant circuit consisting of the small strip of solid copper that served as the bug's "chassis" and a UHF TV tuner varactor.

The varactor was driven directly by the output from a miniature electret condenser mike, with no other amplification in the circuit. I think the sensitivity of that puppy came out somewhere in the microvolts-per-kilohertz-of-deviation range. I've never seen a more sensitive (or quieter!) microphone amplifier -- the final assembly was less than half the size of a 9V battery, and you could hear a whisper across a room with it. Excellent dynamic range, too -- you could switch bandwidths at the receiver to accommodate loud noises versus soft ones.

The biggest problem, obviously, was that you had to continually spin the dial on the receiver to keep up with the drift. That could've been overcome with a wide-range AFC-type tracking loop at the receiver, considering the bug worked at frequencies with no other competing signals to speak of.

Varicap-diode bridges served as the front-end elements in some of the earliest operational amplifier designs. It was actually Bob Pease's account of the history of the Philbrick op-amp module in Jim Williams' first _Analog Circuit Design_ volume that inspired my "superbug" design.

Actually the wireless mic kit has no varicap diode, as with almost all wireless mic circuits. The amplified voice is simply applied to the base of the 100 MHz RF oscillator. The only other transistor in the wireless mic is a buffer/PA stage.

I find the stability of the wireless mik kit I built quite acceptable, even though it uses a slug-tuned coil and ceramic capacitor. Even if it drifts 50 or 100 kHz, the FM receiver wouldn't know the difference. Of course the stability of the local oscillator is important as with any DC receiver.

A fair bit of it is. However, if you were to put a pair of headphones
across this stage, I doubt that you'd hear much. At the very minimum you
would need to add an LM386 or similar. Even the two-diode product
detector used has an audio output not too much less than the electret mic
insert. Therefore if this stage is good enough to get adequate deviation
from a mic insert, it's good enough for this project. Besides, that's
the wireless mic kit designer's problem, and not the constructor's.

>This is a cute idea for a very simple DC receiver. The notes I've added
>may be helpful to someone looking for ways to optimize it a bit. In particular,

I've been playing around with a crude R-C LP audio filtering network.
This consists of a 2.2k resistor and 0.0022 uF capacitors between the
diode detector and the wireless mic preamp. This cuts off a lot of the
highs - useful if you have no graphic equalisewr or tone control on your
rx.

Yah.Better way.

Go to your pubic liberty and see the old QST mags, looking for BITE-SIZE BEAM antennas. They are tiny beams with heavy end loaders on the ends of each element. The thing worked well when I made one for 15 M, many years ago.

You can use it inside your apartment, and not show ANYTHING outside.

It will have the usual good and bad points of beams, plus, it is NARROW band. You can make the loads switchable for different values, since you probably will have it where you can alter it easily.

DO NOT USE IT FOR TRANSMIT, not at the proximity you will have if you hang it off your ceiling.

But you did say scanner.

You might also look in 73 mags, and Hands-on electronics.

Good luck.

How does $20 sound?
Get a standard car radio for $5, at yard sales. and build a convertor.
There was one on this thread sometime back, if I remember right.
The car radio has a metal case which makes it more resistant to
interference from off-freq's, and a convertor can be built out of
scraps of whatever.

I have a copy of this convertor thing, if I can find a way to make it
postable, and if any builders want it.
I will gladly e-mail.

Source record: 84192

To those interested, Version B1.5 of TalkIcom can be downloaded from 'www.mahy.demon.co.uk'.

TalkIcom is an alternative programme to control the Icom PCR1000.

I think it needs a new name, any ideas?

Extract from the readme.txt file:-
About Issue B1.5

This issue has the following major changes.

Will exit properly now on windows shutdown.

Mouse buttons have auto-repeat.

AutoScan button now needs double click to stick down, then scan will continue after busy clears.

The Station Caption states when in Freq mode etc.

3 Priority channels have been added.
These channels are tested at the rate set in the priority control form.
P1 has a higher priority than p2, etc.
When a priority signal is found the button will go fuchsia, as will the station caption.
On the signal disappearing the delay for all 3 priority channels is set by the common priority hold time.
The common priority sample time, is the time allowed for the signal present to be determined.

8 Quick memory buttons have been added. These require a left mouse press to tune to that mem, a long left button press will store the current state to that channel.

All above settings are held in a new .ini file. This file must reside in the same directory as the programme, as indeed must the data bank file 'bank.fql'.

Also the window positions are held in the ini file.

Two options are now given, to either switch the radio off on exit or not, and the option to show hints or not.

This lot has taken quite a lot of work! So I have been pretty bad at answering emails.

This version will again run for 28 days from install, or until 5th May 1998. There should be a further update before this date.

73's de NIS.

Email to 'pcr@mahy.demon.co.uk'.

3733. CB->10m conversions

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-07 00:00:00 UTC
From: rexstout@uswest.net
Message-ID: <rexstout-ya02408000R0704981700580001@news.uswest.net>
Source record: 84195
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,sci.electronics.basics

I have a Pearce-Simpson Tiger 23, which is a 23-channel CB radio, and I want to convert it for use on the 10meter band. I'm just not quite sure how to go about it. First of all, I need some clarification on how it works as it is. It has severl crystals, which are:
10.14 10.16 10.17
10.18 10.595 10.615
10.625 10.635 37.6
37.65 37.7 37.75
37.8 37.85
The receiver circuit is a dual-conversion superhetrodyne, and the example in the manual is channel 9(27.065 MHz). The signal comes into an amplifier, then is mixed with a 37.7MHz signal. That puts out a 10.635 IF signal into the second mixer with a 10.18MHz signal, which is then a 455KHz IF signal, and so on.I don't really understand how it works(I've never been good with theory of operation of ANYTHING), but if I replace some of the crystals with the right value, I should be able to get it into the 10m band, right? OK, lets assume I leave the 10.18MHz crystal in place. For this example, lets say I want to get the radio to 29MHz. If I replaced the 37.7MHz crystal with 39.635MHz, then the rest of the circuit should function right. Right? Like I said, I'm not good with this kind of stuff. Well, I'm going to go read a few books on this and see what I can figure out while I wait for replies. TIA...

Why do you say this? The design described uses an oscillator and a
buffer, how would using a varactor reduce the transistor count?
I think you're overlooking something; the audio is applied to the
base of the transistor and varies the inter-nodal capacitance of
the oscillator transistor (essentially the same as using a varactor).

> receivers.

I've done rather more than look at the circuit diagram. There are
subtleties, and the parts count is far higher than the typical
NE602-based QRP receiver.

I've built several R2 derivatives, with both allpass and polyphase
phase-shift networks. I'm saving my pennies for one of the DSP
evaluation boards to do the job properly, but such an application
is almost an insult to an ADSP-21061. Weaver is also in the queue.
And a whole bunch more. Someday...

Circuit board availability? My best stuff all uses unetched
ugly boards. The main accomodation is using NE5532 dual op-amps,
since things get awfully crowded if you use the quad op-amps
KK7B used. I buy them in quantity, 'cos they're so handy for
all sorts of things.

I'm mystified by the notion that the frequency of operation has
something to do with a circuit being "simple" or "complex" -
audio can be a bitch to get right, and 10 GHz can be dead easy.

Hi,

I am looking for a web site, put up by a Japanese HAM. Recently,
he was discussing a Super VFO, uses two crystals in parallel.

His web site contained some information about other very useful
circuits he had experimented with including schematics and gif files.

I lost the web link.

Can anyone possibly help me find that site again?

It will be useful to other QRP-L folks desiring to do QRP-L
RF circuit experiments. Contains lots of explanation.

Regards, thanks so much,

I have a hamtronics five watt two meter repeater for sale.
It has a r76 reciever. A t51 transmitter. cor board and cw id'er.
mounted in two hamtronics rf tite boxes witch are on a aluminum plate.
Can be put in a rack. Also have all paper work and two sets of crystals.
one on 147.375/975 and the other pair on 147.240/940. Repeater works
great in a duplex operation.It is suggested that if you use a split
antenea system to seperate by at least 150 feet apart. Repeater is 100
percent working and the receiver has a .25 mv sen. The only reson for
saleing is I have two other repeaters and need to cut down on inventory.
I am asking $250.00 plus shipping. This system would cost about five to
six hundred dollars to purchase new and it is in kit form. So you want
have the hassall of building it.

Sounds really good. I took a slightly different approach some years ago. I started with an inherently stable JFET Hartley oscillator. A single extra transistor audio amplifier was built with a fairly large collector resistor. It was capacitively coupled to a tap on the inductor with a capacitor having high X at audio (so the collector voltage could swing) but low X at RF, and driven by the electret mike. The base-collector junction capacitance modulation was enough to get adequate deviation for reception with an FM radio.

Somewhere in the 1940's Radiocraft (now Radio-electronics) published a
5 tube TRF (tuned radio frequency) AM tuner.

I built it about 10 years ago, hooked it up to am amplifier and it
worked pretty good. Finding a 4 gang varible capacitor might not be
easy though.

Still listen to it every once in a while...

=No. The VCO , which you are using as an LO, will switch the
=diodes in the mixer as a GATING signal. In other words, the
=LO will act like a square wave due to the conduction in the
=diodes. It is not reasonable to clean it up to a sine wave
=before application to the L O port of a mixer that is acting
=as a switch unless there is some terrible high harmonic
=content present, which is not usually the case.

A very high _even_ harmonics (different positive and negative peaks)
can be problematic if the signal is AC-coupled to the saturating stage
(as is the case in transformer coupled DBMs), since the saturated
signal does not have exactly 50 % duty cycle. Since DBMs (especially
if used as phase comparators) rely on canceling of some unwanted
components during a full LO cycle, if the duty cycle is not exactly 50
%, some unwanted components will not cancel completely.

A -20dbc second harmonics is 1/10 the amplitude of the fundamental and
should not cause a lot DC-bias shift and duty cycle variation.

Odd harmonics, OTOH, do not shift the DC-bias level and thus does not
affect the duty cycle of the square wave. Very strong odd harmonics
can cause problems if they are so strong that they cause false zero
crossing transitions.

This depends on the sort of phase detector in use.

With a quadrature lock, the accuracy of the 90 degree relationship and
its stability will limit the alternate sideband rejection that can be
achieved.

> As long as they're mixed with the same phase of the mixdown oscillator, sure
> they're still in quadrature.

To get alternate sideband (=Image)rejection in the region of what
filter type structures can do, you're looking to get phase errors much
less than one degree.

DSP systems often digitise before quadrature resolution, so that all
the stuff where phase and amplitude relarionships are important for deep
cancellation lives in the numerical world. Quadrature splitting and
analogue filtering into a pair of lower freq ADCs looks very attractive,
but places very severe demands on gain and phase matching of the
analogue sections.

You can consider the effect of the EVEN order harmonics of your LO to be equivalent to having a mixer with poorer balance. Off-the-shelf mixers routinely have about 10-20dB better balance than your LO will limit you to. Mini Circuits publish spurious tables for their mixers, so you can look at those modes that have even LO terms, and see if any enter your frequency range as the LO is swept across its range.

Many commercial spectrum analysers just use an anti-parallel diode pair as their first mixer, not a double-balanced ring, so the even order terms can be avoided sufficiently.

> The mixer's nominal LO power is 7 dBm (Mini Circuits SRA 5). The VCO's

The effect is likely to be lost amongst other causes of non-flatness. Try it without, first.

Not required at all. I operate all of the above, try very hard NOT to use a key, and I've gotten higher on sniffing solder fumes these last 50 years than almost any other phase of amateur radio. Right on up there with being number 1 on the Honor Roll, having kids and grandkids and all that other important stuff..

And, far from being a "purist" QRP'er, I also try VERY hard not to fight a war with one hand tied behind my back. Why do QRP'ers always take a holier than thou attitude? The guy that gets the awards ought to be the poor sucker that has to COPY that stuff.

Douglas,

some limited past experience reminds me that AT cut crystals running at fundamental frequencies (i.e. typically less than 25MHz) are normally run in the so-called parallel mode, with 20 to 30pF capacity across them.

Series mode seems to be the norm for overtone crystals operating at some harmonic above 25MHz.

It would appear that Robin will need a parallel mode circuit for his 7 -12MHx oscillator - but can you explain why the two circuit modes are apparently assigned as above? Are you implying by your answer that fundamental crystals can also operate series mode - and if so, how do you choose between modes?

That's the kind excellent response we really need in these newsgroups
- make somebody feel stupid for asking a question (could be he's a new
ham, you know) - especially when it's the kind of question that *you*
know the answer to like the back of your hand and obviously everybody
else in the world is just stupid for not knowing it too...

If this is the best advice you can give, I'd suggest not bothering wth
it at all - you're not doing anyone any favors here.

It used to be that this kind of question was what the internet was
about - a collective resource for helping you solve problems - "Ask a
question and somebody will give you an answer." But not anymore -
now, it's "ask a question and somebody will make you feel like an
idiot for doing so."

I for one am grateful to the many amateurs who have offered help for
various problems I've needed to deal with and am thankful that the
people with this kind of attitude are still in the minority...

I made a lucky purchase of some unused state of the art frequency
reference modules that approach rubidium in stability, they divide down
to 1kHz. Most purchasers have used them to provide the reference for
home receiver/transmitter design and construction. Email if any one
else is interested, the end result is about 1000 times more stable than
the reference used in Jap commercial gear..

>It would appear that Robin will need a parallel mode circuit for his 7
>-12MHx oscillator - but can you explain why the two circuit modes are
>apparently assigned as above? Are you implying by your answer that
>fundamental crystals can also operate series mode - and if so, how do
>you choose between modes?

This is a problem of semantics not electronics!
There are not seperate modes only a continuum from below series
resonance (when the crystal looks capacitive) through series resonance
(when the crystal looks resistive ie zero phase) through to absolute
parallel reconance when the crystal looks inductive and resonates with
its self capacitance.

A crystal specified at 30pF can be inserted into a zero phase amplifier
with 30pF in series and will give the same frequency as when it is
inserted in a pierce oscillator where a single transistor with 180 deg
across it has additional phase shift from two RC networks and requires
minus 30pF from the crystal to give a zero loop phase shift.

Modes belong to overtones where a crystal can be induced to vibrate at
approximately odd multiples of the fundemental frequency 5th overtone
gives 100MHz from a 20 MHz fund however because they are not exact the
overtone frequency must be specified as you say almost always series
resonance.

I'm wondering if anyone has any thoughts on IF crystal filter design. I understand Makhinson wrote an article on the subject in the January 1995 QEX. As well, I have Hayward's filter design software from "Introduction to Radio Frequency Design". What I'd like to know is where to get large numbers of high-Q crystals at bargin-basement prices, and general hints on filter construction.

Yes, I could use commercial filters, but I'd like better all-around performance than any of them seem to offer.

Yeah, you want to use a Type I (XOR) type phase detector.

Yes. 50 db image rejection is about the best you can expect with this
technique without taking rather extreme measures. But it is generally
impractical to do direct digital processing at operating frequency, and
if you do it at a low IF, you've already had to use analog filtering to get
image suppression, so the point has become moot.

John OM,

Have you looked at the R2 phasing direct conversion receiver? Simple
to build, excellent dynamic range and beautiful audio. You can build an
audio LPF to set any bandwidth you want. See Campbell's article in Jan
93 QST. Works very well on AM BC band. Kanga U.S. has the blank
double-sided plated thru PC board for this receiver, at $20.

> David GM4ZNX

The 95S-1 has something of an interesting approach to quadrature generation in the LO. Being primarily a DC receiver (DC above 20 MHz, one conversion from 5 kHz - 20 MHz), the LO synth covers the 1 GHz - 2 GHz octave and is divided down as necessary to cover the 20 MHz - 2 GHz DC tuning range. Quadrature generation over this range takes place via a handful of switched discrete phase-shift networks for various subbands, nothing too exotic at all.

The receiver treats this broadband quadrature scheme as an approximation, and makes no attempt to achieve anything resembling precision in the quadrature balance in the LO signsl as it is fed into the mixer. There are no adjustments anywhere in the mixer/LO subsystem

(or anywhere else in the receiver, for that matter!). Instead, whenever a substantial frequency change takes place, the DSP subsystem disconnects the antenna and takes a few milliseconds to evaluate both the LO phase/gain error and any DC offset present in the signal path, and calculates appropriate compensation factors to cancel the effect of the sensed imbalance. Essentially the quadrature balance issue is "fixed in software."

Unfortunately the manual doesn't go into detail as to just how the adaptive balance technique works. The whole scheme is summarized as "The DSP also implements Rockwell Collins Inc. proprietary algorithms which determine and correct hardware induced quadrature gain, phase, and DC offset errors." The details are left as an exercise for the student, although I doubt there's really any rocket science involved.

> >
> > W4ZCB

Hi W4ZCB,

I respect your comments. And I am tickled that you are another tinkerer, who is not a CW op. We are not at odds re: QRP. I am not a QRP officionado myself either. But quite a few builders these days at least seem to start out with QRP transmitters, usually CW. The receiver requirements are similar whether you are using QRO or QRP. QRP is fine as long as the fellow on the receiving end is willing to dig hard for a signal which could otherwise be easier copy if somewhat higher transmitter power was used. I too would rather make it as easy as possible on the guy at the other end!
I suppose there is a trace of holier-than-thou in some QRP adherents. Kind of like the greenies, who not only endorse themselves doing everything in a "green" way, but also insist on everyone else adhering to their interpretation of what is "environmentally correct". In other words, if you are not one of them, you are the enemy.

I realize I was inviting lightning strikes with my comment about modes vs technical and/or operator skill. Kind of like touching the Tar Baby. There are always exceptions of course, but that does not invalidate a generalized statistical observation. I stand by my observations of operator knowledge and operating skill, vs operating mode, at least for the CW and AMTOR/PACTOR modes. This is based on many

thousands of QSO's over the past 14 years using nothing but TOR and CW operation, about 8-10 hours of operating time per week. The difference is very noticeable, and I won't elaborate any further than that. But it is interesting to ponder the reasons.

It is actually harder than it sounds to build a suitable wide-range
PLL using XOR phase detectors, for several reasons, not the least of
which are the limitations of using an XOR phase detector ;-).

I'd be much more inclined to build a single PLL synth running at
4x the desired LO, and use a divider to get the I/Q LO signals.
Just thinking off the top of my head, something like a 30-120MHz
synthesizer (using two octave-tuned VCOs) followed by a programmable
divider, followed by the quad divider would do the trick. Dividing
by one, you'd get a 7.5MHz to 30MHz LO, dividing by 4 would get 1.875MHz
to 7.5MHz, and so on. Just note that each additional division by 4
would make the effective tuning step 1/4 as large. It is hard to get
to 0Hz dividing by 4, but 30KHz isn't too much work.

Food for thought...

I've just updated my test program for controlling the AD9850 via the PC printer port, on my DDS web page (see my sig.). It now allows direct entry of any frequency in MHz, (3.7555, for instance). It would be quite easy to modify the program to sweep between frequencies, for checking filters.

You will need to edit the clock frequency at the beginning of the program, and, possibly, the port address.

The first active amateurs on 6m in Scandinavia were the persons who had
already built 70cm equipment. CW is important on microwaves, but after a
while we improve the rigs to include ssb. We tested some gunplexers with
wideband FM some 20 years ago, but results were very poor for dx.

Last issue of SPRAT #94 (G-QRP-Club) shows some parts of DK3WX
DDS-VFO-KEYER of a CW ELBC-transceiver for 80, 40 or 20m with 5W RF
output. It is written by DJ3KK. The design is based on AD9850, PC16C84
or 16F84 and 100/120MHz xo. AD7008 is avoided since it is terribly
expensive. Also mentioned some RF noise problems using 8051, needs more
shielding than possible to achieve, this is solved using PIC16C84.
Broadband amplifiers uses BFR96, 2N5109 and 2SC1970

cheapest possible item to buy or well designed homebrew circuit?
The best reason to built equipment is that you cannot buy it. If you are
pleased with some simple circuit it is no reason to build it, but it may
not be much worth for dx-ing.
I would prefer to use an old Hallicrafter or National valve RX with an
optional quadrature detector installed. I would also include a frequency
counter for digital display.

> Food for thought...

If You use a 60..120MHz VCO (eg. from Mini Circuit), a programmable
divider (2^n, n = 1..16) and two divide by two flip-flops connected to
the Q and Q\ output (180 deg phase relationship) of the divider, You get
a quadrature signal from 1kHz to 30MHz. The advantage is, that You can
use a VCO covering only slightly more than one octave.
With todays PLD technology I would program just one Lattice PLD. They
work up to even higher frequencies than 120MHz. Not for QRP, but
combined with the calibration scheme mentioned in another posting this
might lead to a pretty high performance downconversion.

Best regards and 73

The AD7008 is an old part-hence its cost.The AD9830 & AD9831
effectively replace it & intentionally cost far less than the AD7008.
They also cost less than the (faster & more versatile) AD9850.

You might try "Fair Radio Sales", Lima OH, Phone # (419)223-2196

I see a 60 and 400 Hz meter in their catalog for $9.95. It's only a 2
inch size though.
But they have tons of stuff in their warehouse that isnt in the catalog,
so if you call
them they can probably find one for you.

There are a number of ways to do a solid state AM transmitter. Collector
modulation in classic plate modulation fashion is probably the worst way.
It is inefficient, linearity is hard to achieve, and if you use bipolars, you have
to partially modulate the driver stage due to its feed through power preventing
achieving 100% modulation if you don't.

One modern approach is to use a hard switched (Class E) RF output
device with its drain voltage supplied by a programable power supply
which is pulse width modulated by the audio.

Another approach uses a number of relatively low power Class E RF
output devices which are enabled or disabled by the modulation (using
A/D to provide the weighted binary gating signals with CMOS gates).
The outputs of the devices are combined to form the modulated signal
in typical D/A weighted ladder fashion.

In both of these cases, the Q of the output tank is used as a smoothing
filter to remove the quantizing steps in the modulation. These techniques
can be very efficient, and linearity can be as good as the A/D system used.
Careful attention has to be paid to the sampling frequency and the tank
Q in order to get a clean signal. This is easy with a narrowband design,
much more difficult if you want a no tune design.

I routinely recommmend R1 and R2 as a jellybean receiver for many
applications. For AM DX use I'd consider stronger mixers (e.g.
TAK-3H, .05 to 300 MHz RF and LO, +17 dBm LO) and would set
the receiver up for selectable upper- and lower sideband -
while the signals you're receiving are double sideband AM, being
able to pick the sideband with less interference is handy.

miniR2 is probably not a good choice for this application. Its
simpler diplexer sacrifices some skirt selectivity, which is an
important parameter in an application where adjacent channels are
always occupied.

I would recommend calling Radio Shack and asking about their discontinued
scanner antenna model 20-013. Still a few left...They are selling them for
$15.00. You can upgrade it to the new model(20-043???) for less than $5.00
by buying a coil(<$2.00) and the whip(<$3.00).
They sell the new model for $79.00(?).

The only down side about this antenna is that even though it is advertised
as a 25Mhz - 1.3GHz scanner antenna, I've found that it works best from
about 100 MHz and up. It is only about 3 feet tall.

I have several modems, myself. Just not sure of the hookup.

Would it be like this?

Sine gen. --> xfmr ---------- xfmr <-- inverted audio
\ /
\ /
\ /
output

Where would the diodes go?

I'll check some books at home tonight

I think you are trying to draw a double side-band generator. You'll
still have to filter out one half of the output.

There are IC chips that will do this much easier!

Let me know if you want more information.

> although crappy design and construction.

Yes, I do, all the time. I have been running them as my main station receivers for 30 years. IFF you are serious about building a GOOD regen receiver, you can build one as sensitive as almost anything else, on the lower HF (they are not so good above 20mhz), and the selectivity will put many ``modern'' sets to shame. Alas, it is a forgotten art form. Most modern regens are toys, not to be fiddled with if you are serious.

A good basic design is the RCA RAL military receiver. Another good one is the early 20's IP-501A and related receivers (scaled up from 600M to 200M and down, of course). Another good one is by Fred Sutter, back about 1939 in QST, ``Selectivity with the 2-tube regenerative receiver''. But, by combining the principles in all those designs, you can make a cracker jack set, with little difficulty, that will serve you very well.

One of the most important things to remember about a regen receiver is UNCOUPLE, UNCOUPLE, UNCOUPLE, UNCOUPLE, UNCOUPLE from the antenna. I regularly use NO antenna for east coast reception on 80M, out to maybe 1000 miles or so. A 6 inch piece of wire for an antenna will start to seriously overload on a good detector, on W1AW, back east here. NO MORE than 1pf of coupling should be necessary for any good regen receiver. For weak signal work into Europe or the west coast, I use a pair of aluminum plates spaced 1/8 inch, that are 1/2 inch square in size, coupled to the regular antenna.

One of the most important things to remember about a regen receiver is UNLOAD, UNLOAD, UNLOAD, UNLOAD, UNLOAD, UNLOAD the tank of the detector. Failure to do that will cause poor Q and broadbanded reception. The mark of a good regen detector is the ability to slice the sidebands off an AM or SSB signal until it is mush. If it won't do that, you have no tank Q in the detector front end. Typically the grid coupling capacitor should be 10pf and the grid leak should be 10 meg ohms for most selective work. Stray leakage will work, if it is in the range of 10-30 meg ohms, but the strong signal recovery time constant becomes fairly large for QSK at that impedance, making QSK a bit rough (10 seconds or more recovery time is impractical).

One of the most important things to remember about a regen receiver is to build it sturdily, and with a very small tuning capacitor, typically a single plate job, with only sufficient additional capacitance to set a band slightly. That will give you good 3500-3600khz full dial spread,

or better, depending upon the capacitor used. If it is not built sturdily, it will be highly microphonic, with most vacuum tubes (solid state is a different horse entirely). There should be no hand capacity effects, or other pulling of the detector under any circumstances. You should be able to set the detector and move it as little as 50 cycles or less easily for maximum CW usability. Shoddy construction makes for a bad set.

One of the most important things to remember about a regen receiver is use throttle control regeneration control if you want GOOD regeneration control. Most other methods don't work as well, in practice, and are usually kludges to keep from spending the money on a good throttle condenser, typically a high quality 400pf or so capacitor. Also, the use of a variometer feedback tickler adjustment is a good idea as a means of setting the throttle to a good range (250-400pf for control of in/out of oscillation is good). Keep the plate voltages low and use battery power for all voltages to keep hum nil. AC hum on a sensitive regen detector is the pits. The use of over 48 plate volts is rarely necessary for good regenerative receiver action, and I usually run 24-36 plate volts. A two stage design is all that is necessary for average use, and a 3 stage design for DX work. An RF stage is not necessary at low plate voltages and loose couplings, but is of use if you run a horridly overcoupled receiver as an isolation buffer.

If you are serious about a good regen design, get in touch with the Glowbugs mailing list (devoted to building OT ham equipment), and they will get you started in the right direction. Send an email to majordomo at piobaire.mines.uidaho.edu or ws4s at infoave.net and that will get you connected --- via subscribe glowbugs.

Good Luck, and have fun regenning!

You might want to get a copy of Communications Quarterly for Fall 1995.

There's an article about regen receivers, starting with background and
including some solid state designs.

The author Charles Kitchin, seems to be trying to resurrect the regen, by
applying newer devices and newer techniques. In the old days, regens were
made as simple as possible, and that's pretty much what we've seen kicked
around all these years since. When semiconductors became available, there
were a whole slew of articles, all attempts to translate those old tube
regen circuits into something using a bipolar transistor or fet. The Doug
DeMaw circuit is an example. When the direct conversion idea hit
the magazines, regens were more or less dropped. Kitchin seems to take
the premise that the regen may have potential, and rather than use it for
a simple receiver, how can the idea be improved? The circuits in the
article are still simple, but not aren't absolutely basic.

Kitchin also wrote a similar article for Electronics Now (was Radio
Electronics) a few years back. I have the article around somewhere, but
can't remember where or the exact issue. It's similar in form and content
to the CommQuart article, though I don't think it went into the history as
much.

Popular Electronics had a regen receiver a few years back. It too was an
attempt to improve on the regen, though that particular design didn't
quite seem right. It added a lot of amplifiers and voltage regulation.
Again, I don't have the date handy.

From other people's comments, I gather that there is a regen receiver in
this year's (and maybe recent year's?) edition of the ARRL handbook. I
would imagine that it is from Charles Kitchin.

Kitchin also had an article in QST (last year?) about a crystal
controlled regen receiver. It used a color subcarrier crystal (3.58MHz)
and was meant for receiving W1AW code practice. I keep meaning to try
that circuit. It uses one of the circuits in the CommQUart article, but
adds the crystal. It's practical and simple. Considering that the local
surplus store has boards (or did the last time I was there) that includes
a color subcarrier crystal and some useable transistors and a suitable AF

amplifier, these could make quite a good club project. Dig the yokes out of some scrap tv sets, and you get the wire for the coil. Go to a photo store and ask for the plastic film cannisters, and you've got the coilforms. Dig the crystals out of junk tv sets, where you can probably get the transistors also. Find somebody with some old circuit boards that have germanium diodes, and the parts are all pretty much free.

I want to try the circuit for WWV.

Another thing to try is using a regen receiver in the IF of a superhet receiver. They used to be called supergainers. Frank Jones, of VHF fame, described a couple years ago. Through the sixties, the idea was seen in simple homemade equipment, sometimes including a crystal filter. Often, the regen detector was crystal controlled.

I don't think I would do that myself (those crystal filters do seem expensive) but at the same time it does have potential. If someone is willing to spend plenty of money on commercial equipment, and many are, one could look at homebrewing not as saving money, but as building something the way you want it. Spending money on the filter (and in the past I've thought that one could buy an external commercial VFO to take care of the problems involved in that, at least back in the old days) might not save you money, but if it allows you to build something you want, and wouldn't otherwise because of filter problems, then you are still ahead.

When this thread came up, I immediately thought of Ray Moore's article in
Ham Radio year's ago (and thanks to the website, I don't have to dig to
get the date, which was June 1974. It's one of the few articles that I've
seen that attempt to build a DX receiver for the AM BCB band. I gather
from the references on the webpage, others are doing it, but the
information is directed towards those who are interested, rather than
appearing in general radio or electronic magazines.

At first glance, that receiver was fairly standard; single conversion
with a 455KHz IF. But he used a 7360 mixer, and good filters which were
cascaded. He also used a good dial.

It probably is still good reading for people who want to pursue the
subject. The design with it's tubes may be outdated (I notice the
article on the webpage says that he uses a MOSFET in the mixer, and it's
as good as the 7360), but he goes into what makes a good AM BCB
receiver, which is not quite the same as some other receiver. I can
also imagine that a great AM BCB receiver would not be quite the same as
a good AM shortwave receiver, though there is overlap. He wrote some
other articles around that time on receiver design for Ham Radio, also
worth looking at if you can get ahold of the issues.

hello mike,

I have in the past built very good regens using toroids and FETS,
and
when I tried to build a crystal controlled regen,
I got next to nowhere.

After some time I realized that the Q of a crystal is so High
(50,000) and when we multiply it by say 100, which a regen wil do,
we get a Q of 5,000,000, and that means a BW of 1 HZ or less at 3.58
MHZ.

NOW to receiev even CW, we need bandwidths of 100 HZ or so.

PLUS, for CW, the detector has to oscilate. If it is made to
oscilate, at say 600 HZ so that we can hear 600 HZ note,
what will its sensitivity to signals which are off 600 HZ be
with a bandwidth of 1 HZ or less ?

I would be really surprised, and I think that it must be purely
black magic or really LOSSY crystals , usiing which somebody can
build a crystal controlled regen.

Please prove me WRONG !!!

However, it should be very much possible to build
a ceramic resonator controlled regen. That would be fun !

They work great. My trans-receiver is a Ten Tec Regen Kit #1054
receiver and using a Oner for the transmitter. Am changing the
transmitter to a "Little Joe" (Dan's Small Parts kit). The receiver
gives enough bleed-thru to provide a sidetone. I currently use a
dpdt relay for the antenna change over, but a diode TR switch
is in the making. If you like to tweek knobs you will enjoy this
setup, but its not for the couch potato crowd :-)
good luck Walter AG5P

I found a box of 50 small plugin 13.101Mhz xtals for 25cents each back in the early
80's at a place somewhere in Phoenix. Not sure of the significance of 13.101Mhz.
Built 3 6 xtal "Ladder" filters at 2.4, 2.7, 3.0khz BW, typical 9db IL, 90db Ultimate
Rejection with .5dB ripple. Of course I had access to a Spectrum Analyzer at the
time but other techniques using homebrewed test equipment described in past QST articles work fairly well, just takes a bit longer to adjust.

Yes I did use them in my Homebrewed Rigs with excellent results.
I sold off the spares long ago but places like Digi-Key has xtals that maybe fairly cheap in quantities.

Paper caps are unjustly maligned, IMHO -- everyone will tell you not to use them on pain of death, but I can't remember ever seeing one fail in my youthful days of tinkering with every old AM tube radio in sight. Use 'em. (I like a 2X voltage safety factor, myself, but it probably isn't that big a deal.)

Antique Electronic Supply (http://www.tubesandmore.com) has some other options, including Sprague Orange Drop replacements, that might be more reliable in the long run.

Has anyone seen or tried using the Harris HSP45102 DDS? This DDS is far less expensive than the Analog Devices chip, about $6 in large quantities and should be around $10-15 in singles. It does have fewer features, 50Mhz max clock, requires an external D/A and does not have I&Q outputs, but for the price it's really great for us hobbiestes [sic :)] It also is in an SOIC surface mount package, although small, it's still easier to work with compared to the PLCC package of the AD7008.

I used a simple binary resistor network for the D/A (i.e. 2k, 4k, 8k, 16k, 32k...) and an LC filter to smooth out the quantization noise. An 8052 microprocessor tuned the DDS driving an NE602 mixer. This simple DC receiver worked from the AM band up to about 6Mhz.

I think the web address is http://www.semi.harris.com

Have fun,

I disagree... the information in books can get quickly outdated... also... a book can contain only so much information, the internet is VAST!... why limit yourself... I have books and I refer to them often... but I tend to start on the internet.. I get lots of information, different opinions (instead of the opinion of just one author)...

The internet is just one big electronic book... nothing wrong with using it :)

Rick:

First of all, I used to know a guy by the same name, have you
ever worked on the central coast of California??

As for your question, last time I built a small 'beeper' as you've
described I used 2 chips and just a few discrete parts.
The chips were the 556 dual timer and a 4017 decade counter.
One half of the 556 is wired as an astable oscillator to produce
the desired 'beep'. The other half of the 556 is wired as a
monostable timer to pulse once every X seconds. The output
of the timer clocked the 4017 and at the specified setting the
output pin of the 4017 pulsed the oscillator and produced the beep!
The 4017 then resets and the evolution starts again (and again and again
until you shut the bloody thing off).

Hope this helps you along.

Regards,

Shawn Dienhart WB6JWB

I'd like to buy a vibrating reed freq meter centered on 400 Hz, range
around 360 to 440 hz. 2 1/4" or 3 1/8" dia ., square or rectangular meter
OK.

Try this: disassemble radio and remove the coil cans in question, one by one, dont mix em up!. Use a solder sucker iron or you will destroy them! The "screwdriver" slot is also on the bottom side, which IS accessible on those coil cans! Simply unscrew them, throw away any crumbly bits, and reinstall them upside down. (The cores, that is). Realign the set and your'e back in business. Almost every one in my HTX'es is very near, or at, the top of the metal housing, so that is where you should probably set them when starting the alignment.

John,

I've just added an article re: a homebrew mediumwave receiver (by Ray Moore) to my page. Over the next little while, I will be adding another by Nick Hall Patch. Both of these are also available as IRCA reprints Moore's is IRCA reprint R83, while Patch's is IRCA reprint M56. The IRCA Bookstore is at this URL:

http://fly.hiwaay.net/~waholler/bookst.htm

Scott I have had good success homebrewing some small VHF/UHF antennas =
for temporary/ experimental work. They are pretty easy to make if you =
can do a bit of basic soldering.
Use an SO239 panel socket and solder a brass welding rod or stiff copper =
wire into the centre pin. Length is calculated from 300 div by freq. =3D =
300 div by 220 =3D 1.363m and div by 4 to get quarter wave, which is 340 =
mm or 13 and 3 eighths inches. Solder and /or bolt with small bolts, 4 =
similar length copper, brass or aluminium rods or wires, to the holes in =
each corner of the panel socket and bend them down at 45 or so degrees. =
Connect to the radio with a short patch lead terminated in a PL259 plug, =
which will fit into the SO239 from underneath. If this is too clumsy to =
us indoors you can mount it on a light bracket on the window sill. =
Connect to a VSWR meter and adjust the match for under 1.5 to 1, by =
first trimming a small amount off the vertical wire and rechecking. Then =
raise or lower the angle of the 4 radials to get the best match. This =
antenna is shown in the ARRL Antenna Book on page 18-16 and 18-17. It =
works very well and costs very little.

jw>Hey all....
jw>I've been thinking of building another HF AM transmitter, and this
jw>time I'd like it to be solid-state. Since high-level modulation
jw>offers the best performance, I'd like to design the final for class
jw>C and collector modulate (is that the proper term?) the final.
jw>I work with solid-state transmitters and surface mount components
jw>on a daily basis with my job, but these are all FM. I know how to
jw>modulate a 6146 or a 807 for example, but how does one accomplish
jw>high-level modulation on a transistor? Since the devices generally
jw>require at least 12v at several amps, it seems to me the minimal
jw>resistance of the secondary of a transformer would introduce
jw>unacceptable loss in the collector source.
jw>I'm considering using transistors such as MRF428A biased in a class
jw>C configuration. It would be run conservatively at about 100 watts.
jw>Achieving near 100 watts of audio for the modulation is easy enough
jw>with the monolithic devices available. But - how to couple this
jw>audio to the final RF stage? Any possible URL to study or book to
jw>review would be greatly appreciated.
jw>Can somebody help? Running my DX-100 and Globe Scout on AM is fine,
jw>but I'm really curious to try and build something modern.
jw>Hopefully I won't have to resort to low-level modulation and run
jw>the amp linear. This defeats the goal of what I'm trying to do.
jw>Thanks!
jw>-Joe N6DGY

Why not just connect the speaker terminals of a 100 watt audio amplifier
in series with the DC power supply?

You might need a hefty inductance which could carry the approx. 10 A DC
supply.

Or use HALF the DC, and let the audio amp supply the rest (on average).

Or use a large L in common series with the audio amplifier and the class
C amplifier.

Or a speaker matching transformer (capable of taking the DC).

etc, etc...

I have built that VXO circuit and recommend it highly. The best I've done
was to get 90kHz swing from a pair of 10 MHz xtals (HC25 size). The
improvements in shift compared with a single crystal are 40-200%
according to tests I've done.

>cutoff filters.

Joanne is correct many low cost crystals exhibit a different resistance
at very low levels compared to high level this is usually caused by
surface contamination. The effect on oscillators is to make starting
marginal after a period of time, filter crystals with this
characteristic give rise to low level intermod.

I am not a professional filter designer however I do know that fast
cutoff filters have variable group delay across the band and exhibit
ringing and are very bad for data. Some years ago I made some non
ringing filters by employing multi stages of low cost monolithic duals
at 10.7MHz each stage isolated by a gain stage.
I an surprised by the apparent high cost of crystal filters; filter
manufactureres only get a few $ for 8 pole 10.7 and 21.4 MHz filters
from radio manufacturers.

I built Doug's circuit from QRP notebook and had a lot of fun with it, but (with my version at least) its not really useful for making QSOs. (You'll note that Doug seems to have only grudgingly included the circuit in the book.) As others have indicated, I think you're better off with a good capacitor to control the feedback - the pot in the circuit your talking about doesn't do such a good job. I should have paid more attention to mechanical stability - I ended up with a lot of microphonics and general jumpiness.

A fellow in our radio club brought in an Ocean Hopper. It made me a believer in regens and mademe realize that the poor performance that I got from my HB effort is not the norm.

Harris also makes a very nice 12-bit DAC, the HI5731, good to 100 MHz.
I used it with the Qualcomm Q2234-50 DDS chip with excellent results.

If you're going to go to the trouble of using a separate DDS/DAC
solution, IMHO Qualcomm is the only way to go. They have various
patented spur-reduction techniques that help cut down on both
amplitude-step and phase-truncation spurii, and you sure can't beat
their data sheets for clarity and thoroughness.

OTOH it's arguably easier/better to use an AD9850 with a cleanup loop
and get even cleaner output than you'd get with a Qualcomm part and
(expensive) Harris DAC.

The other nice thing about the Qualcomm part, as opposed to the AD
parts, is that it's parallel-programmable. You can do a frequency
change without 50 or so port writes to your LPT port to toggle the
AD9850's serial lines. Of course you pay for this convenience by
getting to wire up a 68-pin PQFP. Dunno how the Harris DDS parts are
programmable, but I prefer parallel myself.

You would not want to use an NE612 up there. Check out
http://www.minicircuits.com -- they have enough mixer and filter choices
to make the job a trivial one.

A cascade of several low-order Cheby xtal filters, separated by gain stages, creates an approximation to a Gaussian or Bessel response, which has good group delay properties.

This is quite trivial with a simple microcontroller like the PIC 16F84
or the AVR 1200. One 20-pin chip, a decoupling capacitor, a switch, a
ceramic resonator, and a transducer, in the case of the AVR.

Here's a simple AVR program I wrote to check out the timer function:

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.swap,rec.radio.swap

I bought a HTX-100 at a hamfest and found out that EVERY
SINGLE COIL had its ferrite slug damaged or pushed to the
bottom. I'd like to find someone who has a HTX-100 that's
dead because of semiconductor faults. I have contacted
Tandy and found that they stopped restocking the replacement
parts for this thing a couple of years ago. If you have a radio
that may fit the bill please email me with your price.

I have looked into removing the coils and unscrewing them from the
bottom. Some can be done others actually have a bottom that
prevents ANY access. To make matters worse the wingnut that
messed this radio up didn't stop at just breaking the ferrites. He
went so far as to drill out the broken ferrites and totally trash the VCO
coil as well as a few others.
The point has been made that the HR 2510 was also made by Uniden
and probably has the same coils. Well that's true but in my case the coils
that are trashed aren't used in the 2510.
I thought of buying both service manuals and comparing parts but
at a cost of >$50 for a radio that is only worth $80 I thought again.

Ok...since it was my post that started this thread I'll throw my 2 cents in. I admit it...I didnt think of the ARRL Antenna Handbook. I did look elsewhere though including ARRL handbooks and past magazine articles.

I posted a simple question. That's it. If someone wants to get bent out of shape that's their problem....not mine. Life's way too short to be worring what some yahoo thinks.
Little minds have little thoughts.

As far as letting someone else do all the work for me...well, anyone who knows me, especially as an amateur radio operator, knows that that's simply not true.
If you have a problem with me keep it to yourself.

I use the internet quite extensively. I enjoy and value it's resources. That's the way it should be. I appriciate those that offer information, opinions, and solutions.

Thanks,
Brian

I have two dozen Foster lightweight commercial quality communications headsets for sale. Each headset is fully adjustable with one foam padded earpiece/speaker and articulated electret mic. The connecting cable is three feet long with a standard 4-pin mic plug with index notch on the end. Included instruction sheet shows 2 interface circuit diagrams for use with Kenwood, Yaesu, Icom and Radioshack radios. $7 each (plus $3 shipping) or 2 for $11 (plus $4 shipping) prepaid. E-mail me with questions or to get my address to send your order.

Thanks,
Scott Adams

If you're really concerned with spectrum conservation, then go after
those who use a kilowatt when conditions would support communication
with five watts. Such people are wasting 995 watts and unnecessarily
raising the ambient noise level on the band.

E F Johnson Desk Kilowatt transmitter with EF Johnson Viking Ranger exciter. No desk, RF pedestal and exciter unit only. Good condition, has been in storage for several years. Comes with operating manual.

This is a true vintage piece of AM/SSB equipment. Designed to operate at ONE KILOWATT of high level amplitude modulation. RF unit is continuous coverage from 3 to 30 Mhz.

Price is $3500 for both units. Will consider trades.

Now why didnt I say that :)

As an interested observer I would note that the most common IF filter
problem experienced by generations of professional radio designers is
the inability to achieve manufacturers claimed stop band due to
inadequate or incorrectly placed ground plane and feedthrough from input
to output by radiation. This is followed inability to meet pass band
ripple due to inaccurate termination impedance.

The following was circulated about 10 days ago. About 60 percent of the tubes have sold but the remainder (parts and tubes) are still available. Give Mr Anthony a call and load up on old parts...
Thanks!
Howard Weeks

Radio / TV Repair Shop Parts for Sale

Anthony's Radio and TV Repair, located in Augusta, GA since 1951, is closing due to the owner's retirement. The modern equipment and parts have been sold; however, there are approximately 120 lineal feet of 6 foot high shelves loaded with new and used old stock parts available. There are in excess of 5000 tubes of which about 75 percent are new old stock in the boxes. The rest are used tubes in marked boxes. Based on one quick look, I would estimate that about 85-90 percent are TV oriented tubes. The rest are 6 and 12 volt, etc. There are probably 40 or more lineal feet of shelves with new old TV parts and assemblies. There are about 20 or more feet of components such as resistors, capacitors, etc. There are over 100 power transformers (used) that are "pulls" from old television sets. The rafters are covered with small transformers and filters of all types. There are no old radios or TVs available. There are a few pieces of old test equipment. I saw two old B&K Analyst sets and one other that was some kind of signal generator.
The owner, Ed Anthony, is interested in selling all or part of it. He will take telephone calls between the hours of 12 noon until 9 PM Eastern Standard Time. His telephone number is 706-863-4269. He has a detailed inventory but it is on "many" pages of paper so is not available via the net. He does not have email access. Should anyone have an interest in this rather large truck load of parts, please give him a call. I do not know what he wants ($) for it. I will answer email questions on it for him - but only to the extent that I know it. I have had only one quick look and I have repeated (above) about all I know about it. Thanks for reading!

Howdy Pete.....with the voltages you are looking for....I'd try to scrounge a small (only 100 to 150 watt) computer UPS...probably for use with a single 12 volt battery to match your boat battery. Output is 120 vac nominally....just rectify and drop with a simple resistor divider.....Come right off the 12 volt input with a voltage divider resistor string for your 1.4 volts.....and drop off the 120 vac side with a resistor divider or small transformer (5 or 6 vac typical) and then rectify for a negative output to ground for your required -4.2 volts...filter and regulate as required. These small UPS without batteries are a dime a dozen around it seems (no one wants to pay $$$$ for the new batteries) and all the hard stuff is already done for ya!

Have fun!

Gord

I haven't heard of Unitrode getting out of the business of Pin Diodes, guess I'll see if they have a Web Page and check it out. Frequency Sources also has excellent Pin Diodes.

On what diodes did I use, well I'll have to dig through my files and post it to the
group.

Someone had a question on a 1N4007....This is a 1A 1000V Rectifier if I remember
correctly, not a Pin Diode but some do work in the lower HF region but Rs may be
a bit high.

Those 35 year old paper caps are probably going to be just as leaky as
the ones in the radio now.

3859. WTB Dead HTX-100 (3)

The really BAD coils in this HTX-100 are:

FT-2 (triple coil set in the upper right corner, going front to back)
L317 (VCO coil on the PLL/micro baby board)
L1,7,8,12,13 and L26 the rest don't look great but I hope they are
still intact and just need a new slug.

If anyone has a chassis that they want to part with I'm still looking.

>with a bandwidth of 1 HZ or less ?

I think it depends on what what exactly is meant a regenerative detector.
While most regenerative detectors do generate their own heterodyne signal
(for CW reception) by being adjusted into oscillation, it is also possible
to have a regenerative detector, which is slightly below the critical point
and thus not oscillating, fed by an external heterodyne signal. This is
what I would think of if I heard of a crystal-controlled regen -- the
crystal would control the heterodyne frequency oscillator while the
regenerative detector would have a normal LC input. The term "autodyne" was
often used to refer to an oscillating detector, and "external heterodyne" or
"homodyne" to refer to the non-oscillating regenerative detector (or perhaps
any detector that converted directly down to AF, I'm not sure about the
exact useage).

have to replace some old capacitors in a boatanchor project. Need some
douzens .0047 300V, wonder if old unused paper capacitors may be OK?
They are 35 years old.
During operation the voltage will be +220V or less, the capacitors I
have are rated 250V, but output from the rectifier may swing up to 280V
when switched on - until the valves are heated up.
Any opinions are welcome

I think you've missed the boat, Marty. The Internet should not be the FIRST place one looks for answers, it should be toward the LAST. Too many times I've seen a question asked which shows the asker has not even touched a book on the subject. I'm glad to help someone who has tried their best to solve a problem, but I'm not inclined to help someone who wants me to do all the work for him. Make sense?

Very good! You simply cannot beat a car radio. Some people prefer the older models which are not digital, but those don't go to the extended AM band. Of course, if you hunt for split-channel DX you'll need one.

I guess you could run an auto vertical whip up to the roof or something. I doubt that a longwire would do much except maybe overload. A loop would be good, though. A Select-a-Tenna wouldn't work.

Another IC that will give more precision (if you need it) is the
CD4060B. It's been around a long time and circuits can be found in
any RCA/HARRIS CMOS data book. It can be configured as a crystal
oscillator with it's own built-in binary dividers. You can pick off
the proper divider output (it has several) and use that to trigger a
beep circuit and reset the dividers. It's a LOT more circuit design
work than a 555, but it is one way to get crystal precision, which the
555 can not do.

Hello. Does anyone have a resource for homebrewing hf yagis? I've
visited a number of sites dealing with homebrewing antennas but very
few have any info on hf yagis.

I am interested in homebrewing a 17 mtr monoband yagi.

Thanks,

> a $painful one at that).

If you spend significant bucks on the filter you can buy filters designed for

high dynamic range receivers. They have special design considerations and
cleanroom techniques to reduce the effects of the inherent non-linearities
in the quartz crystals themselves. WAY back in the 70's it became an issue
at the Frequency Control Symposia.

It ain't only the skirt selectivity that's needed tog et 120dB dynamic range.

Also watch out for filter ringing. That can negate the effects of very sharp
cutoff filters.

Ah! that's what you want a filter design programme for...

This is a pretty standard approach, but take a little care which side you put the Xtal oscillators on - it isn't just a matter of rversing the tuning direction, there is also the matter of spurii.

As an alternative to the mixer and filters, G3ROO and myself did a PLL summing loop. Ian published it in Radcom, I put it in the ARRL handbook(Chapter14, all editions 1995 and onwards)

> A couple of questions:
>
> 1) When looking at oscillator designs there are two families,
> depending on whether the xtal is driven in a series or parallel mode.
> What are the merits/demerits of each approach.
>

ALL Xtals have both parallel and series modes. When you order a crystal and specify the mode, you're simply saying which mode the freq spec applies to. All crystals also have the full set of fundamental and overtone modes, each with its own parallel and series mode resonances. As if this weren't enough, all crystals also have a large number of "spurious modes" - quite often in large clusters of many resonances all close together. Even these spurious modes go around in parallel-series pairs.

So, if you order a 3rd overtone,series mode xtal for XX.XXXXXX MHz, the quartz manufacturer will grind a crystal blank until the third,series, mode comes up to just that frequency. Posh crystals go through a process of finer and finer grinding then polishing processes and finally a hand-lap. The manufacturer has worked out allowances for when to go to the next stage for efficient production without too much risk of waste. Crystals can also be artfully contoured in grinding, and this affects the relative activity of the main modes and the spurii. A good manufacturer can help you a bit by favouring the activity on the mode you specified, and reducing the activity a little on the others. This is still not really enough to reliably force the fundamental or

overtone number. Good practice is to always have an LC tank in an oscillator to make absolutely certain.

> 2) I have never specified xtals before, do I state the mode of
> oscillation and the frequency or what?.
>

Yup, and what kind of package you want it in,what "load", what frequency accuracy, what stability over what temperature range (sets angle of "cut" - the relationship of the faces to the crystal's molecular lattice axes)

GOLDEN RULE number 1: Phone the crystal firm and ask what they want to know, and what the price is.

> 3) Also the books refer to oscillation taking place at frequencies
> slightly lower than the parallel or series modes.. If so, and given that
> the final frequency is what I am after. Do I give the mode and desired
> frequency or the nominal frequency of the xtal?. E.g., do I say:
> serial resonance 5.001MHz or serial resonance and 5.00 MHz given that my
> final frequency is 5.00MHz.
>

This is really a quirk of some osc circuits, not the xtal. There are circuits that run the xtal on its design freq.

You might specify, say, a 30pF capacitive load for a series mode xtal. This crystal is then cut so that it expects to see a low-Z oscillator circuit and 30pf trimmer cap in series across its terminals. Varying the trimmer allows a small amount of freq adjustment. Specifying this way allows the manufacturer to offset the xtal a little so that the wanted mode is in spec with your trimmer at 30pf.

> The oscillator that I want to make will have three or four switched
> ranges in the 7 - 12 MHz region. Will have to be relatively stable, I
> am not resorting to ovens etc, just the best I can do with good
> components and a reasonable deign.
>

Switching xtals in an oscillator is a nightmare to prevent spurious oscillation. The different rocks also will have different levels of activity, so you'll also find trouble trying to get a circuit that can get all the rocks to oscillate without some of them going into some form of misbehaviour.

It's a lot easier to build a number of oscillators, and switch THEM. You can twiddle the values in each to suit its own xtal.

Hope this helps a bit,
David GM4ZNX

I've seen some other than low cost crystals exhibit this ("lazy
crystal") property.

Using an HP3577 network analyzer and some homemade software, I
measured ESR vs drive power at resonance in a batch of crystals.
After pluging the crystal into the fixture, I increased the power from
the microwatt region up to a millwatt or so, then swept the power back
down to the starting point.

Plotting these data showed a hysteris effect on some of the crystals;
the ESR started off high (a few hundred ohm) dropped to a much lower
level (10-20 ohm) as the power increased and STAYED LOW as the power
was decreased to the starting point. Unplugging the crystal and
starting over would produce the same pattern.

A close approximation to Bessel/Gaussian requires many cascaded filters. Three or so makes a worthwhile improvement. It has a couple of other benefits.

I had a lot of trouble with contamination problems in xtal filters. Heating the filter to 70 degrees C for a half hour or so would do a temporary fix but the problem always came back after a few hours at room temp. In-band intermod measurements exhibited a hysteresis effect for increasing and decreasing sig levels.

The filter vendors learned how to fix this with clean-room procedures.

Hi Wes,

> greatly received.

You can use a PIC12C508. It costs about $1.50, comes in 8 pin case (if you buy the SO version you'll find that it is smaller than a wrist watch battery).

Let it run with the internal oscillator (not XTAL or resonator needed) from a single 3V lithium wristwatch battery (no voltage regulator needed). Put it into sleep mode until your button (no external pullups needed) tells it to GO (interrupt pin).

Beep with a piezo buzzer, using a differential setup (two IO pins, with A opposite of B, toggeling polarity at the buzzers resonance frequency). This will emit loud enough sound (no other parts needed).

All in all you have the PCB, the PIC12C508, a battery, a battery holder, your start/stop button and the buzzer. The largest part will be the buzzer. For really small batteries check out hearing aid shops.

You can fit all into about 1 cm^3 if you really want it _small_.

A conceptually simple approach, Paul, but the LP filters and everything
else from the mix-down on would have to be phase/amplitude matched over
a DC-30MHz range to preserve the accuracy of the quadrature.
(the Devil's in the details ...)

It used to be a common complaint that 8pole filters had 100dB stop band
capability but only achieved 60dB when mounted on the customers board.
Incidently I did early synthesisers for sonarbuoy TX probably used your
receivers.
I used to think that making sonarbuoys was like making TVs and then
throwing them in the sea.

I am certainly interested. I have studied the Jan 93 article. I need
another receiver for cw contests on 80 or 40m. Any experience in using
such concepts when signal levels varies much? Is the selectivity delt
with in the dsp concept?
Normally I use FT-902 with DSP-9. With marginal condx I cannot do
without 100Hz BW.

I wrote a note to G3VA about a two-xtal 18.556MHz roofing filter. The filter is designed by LA7MI Stein Torp. The filter is used in his 40dBm IP HF receiver project. It is presented in Technical topics, Radcom Dec 95 pp.71. It uses a pair of 5th overtone 92.8611MHz type HC18/U (HC49) xtals. Performance: -3dB BW=6kHz , -30dB BW=42kHz, 80dB BW=840kHz, ultimate rejection is 90dB. Insertion loss is 1.5dB.
Two bifilar wound transformers (2x 16 turns .25mm enam cu wire on T37-2 core) are used with 2x 2-4pF neutralizing capacitors. The filter is designed for 50 ohm.

The reason for using this frequency is only that the xtals turned out to have low spurious responses (as measured with HP8505A network analyzer).

The details shown in Radcom are based on correspondence with LA7MI, he does not have email (not even a PC), he only has a telephone. His current project is a 40W 80m ssb transceiver with VMOS power amps in SMD technique, with hand cut PCB pattern (using small dentist drills), PA IMD was measured to 20dB. He has made several solidstate 80m ssb transceivers and receivers during the last 30 years. Many of the ideas I have described in Radcom is based on his circuits.

Yes I recall that hams were using the 1N400X series as PIN diodes as
a cheaper alternative but have never seen any data on them for their
PIN characteristics.

For those out there that wanted to know what PIN diode I used in the
commercial
design it was the Frequency Source's KS1001 rated for 1000W of RF 2-30Mhz.
Vr = 1200VDC, If = 1.5Adc, Pd (free air) 1.5W, Using Heat Sink mounting 3/8
in
leads = 5W, Rs @ 50Mhz with If = 750mA = .14 - .20 Ohms.

And Yes a Heat Sink Mount was used.

With all this interest lately in Pin Diode Switches guess I know what next
to
add to my page.

Are you sure it's a FET? The Mini-Circuits MAR-xx line of UHF amplifier MMICs are marked that way. The MAR-8 is marked A08, with a white dot near the input pin. If that's what it is, you can get the data from http://www.minicircuits.com.

When I was designing sonobouy receivers we had to build a fixture that the filter companies could use for the testing. We could REALLY get down far with the spectrum analyzer/tracking generator arrangement I built. It proved mounting was very critical at the 80dB and higher levels. 60dB is a piece of cake, relatively.

<grin> Yeah, sorta.... My introduction to really exotic filters was a fast frequency
hoppiung 30-90Mhz military radio proof of concept design. We had McCoy build us
a very nice filter for our IF. (About 5ish to 9ish MHz if i recall - this was 'bout '72
or so.) I played with the filter with some nice pulsed signals with low duty factor.
I watched things on a spectrum analyzer set to a wide bandwidth and zero sweep
that was sinchronized to the RF pulses. The poor filter rang line a banshee once
the ringing got down to about 40-50dB down. (We needed to meet 80dB.) It seems
energy would couple into the filter crystal's spurious resonances. I'd see a distinct
pattern something like multiple overlayed diffraction patterns on the filter output.

I pulled out a network analyzer and VERY slowly and carefully swept the passband.
I found leeetle pips, about 1/20th dB, in the passband and upper stopband. The
spacing was perfect for creating the ringing pattern. And filters with bigger pips

rang worse. Designing the kind of filter we needed was REALLY hard it turns out.

(Lemme see - didn't you work for Collins in those days? It was a year or three later
that we (Rockwell Anaheim) performed a technology transfer over to Collins for the

FFH work we'd done at VHF and then UHF. Fast in those days was in the 5-10
kilohops/sec range.)

You probably dont want a 5th overtone oscillator directly at 144MHz
because pulling is bad and direct FM difficult. You either need 16MhZ
and 2 times X3 multiplier stages or 14.4MHz osc devide 10, PLL and VCO
at 144 .

It is certainly more than a passing fad. FIR filters *do not ring* at all, no matter how narrow they are. And group delay can be perfectly controlled. Brick wall response can be obtained without unacceptable phase distortion in the passband. There is also the very great advantage of being able to implement demodulation of any arbitrary modulation form completely in firmware. As A/D converters get faster, and DSP processors get wider, the day of the totally digital receiver becomes closer to reality. In a few years, analog receivers will be considered "quaint", just as the CD has displaced the LP. The difference is really that great when implemented properly.

You may also be interested to know about RF boards for 1.3, 2.3, 5.7 and 10GHz Weaver (Third Method) transceivers designed by S51MV. These are complete RF-to-audio down- and up-converters including bilateral I and Q diode mixers, RF quadrature phasing and filter, RX low noise amplifier(s) and TX output amp(s), all on one board per band. All of the RF circuitry is in stripline and is no-tune.

The frequency source is a multiplied VXO, different for each band of course.

The audio part is common to all of the transceivers. In the RX path there are identical I and Q channels, each with two stages of audio AGC, low-noise preamplifier and lowpass filtering.

Modulation/demodulation is analog, using the Weaver method, but the hardware described above could equally well be used with DSP and/or the phasing method.

Details are currently being published in the DUBUS VHF/microwave quarterly, in four parts. For information about DUBUS and your national agent, see http://www.marsport.demon.co.uk and follow the DUBUS link.

Unfortunately AFAIK there is no information on the WWW. According to the magazine there is a contact address in Slovenia where parts and boards are available (jure.mikeln@svet-el.si) and you might also be able to get reprints from there.

Sounds like a job for a PLL. VCO runs at 144Mhz.
divide by 9 to get 16Mhz. Since a VCO is not very stable,
or accurate, compare the divide by 9 output to the 16Mhz
crystal osc. Phase comparitor output will pull the VCO
to keep it in sync with the crystal osc.
OK, now you can FM modulate it by summing in your
modulating signal with the phase comparitor output.
I've shown you the way. The details are your's to
figgure out.

Just my $0.02 worth.
Hope this helps,
Gordon

The 1N4007 IS a PIN diode, although it's intended as a rectifier. It contains an intrinsic region to increase its voltage breakdown. I recall that Tektronix at one time had a part specified as a 1N4007 with a *minimum* storage time spec, that was used as a PIN diode. Apparently they work quite well as PIN diodes at HF, although they may not be as good in some respects as diodes intended for this use.

I learned this from Wes Hayward, W7ZOI.

I've been using a DSP version of the R2 for over a year now. It is very
nice for such a simple and cheap receiver. But it is not a perfect receiver.
Opposite sideband suppression is indeed only about 50 db due to various
imperfections in quadrature balance, so you will get bleed from a nearby
signal on the other side of zero beat. (Though I read with interest the idea
of correcting quadrature errors on the fly in the DSP. That could allow
opposite sideband rejection of up to 90 db in theory. That'd be super.)

My receiver uses no AGC, so you have to ride the RF gain by hand (I use
a preselector and variable attenuator in front of the R2). The receiver in the
current issue of QST attempts to do AGC in the DSP unit, but I found that
unsatisfactory. Because of the delay through the DSP, you will have problems
with AGC overshoot and undershoot, and it may oscillate under some conditions.

I gave up on that.

I may come back to it later using a different approach. I think I'd leave the analog audio stages in the receiver and do an audio derived AGC driving an electronic attenuator in front of the parallel DSP. That'd get rid of the delay which plagues AGC through the DSP. That's not ideal because it would only have the analog filtering in front of it instead of the much sharper DSP filtering, but it would prevent the pumping the DSP delay introduces.

The lack of AGC doesn't really bother me. In the old days, we always rode the RF gain control by hand anyway. And I have no problems from a nearby signal pumping receiver gain and pushing the desired signal in and out of the noise as an AGC system can do. I don't wear headphones while using this receiver, however. That could be painful at times.

You do get brick wall filtering that does not ring by using the DSP. You can narrow the filtering as much as you like, but remember you'll also hear a comparable bandwidth of the opposite sideband 50 db down. The DSP can also demodulate any arbitrary modulation (with the proper firmware of course). It is an excellent way to demodulate digital modulations such as QPSK, QAM, and other M-ary modulations. And for voice, the audio quality is spectacularly good because of the lack of group delay introduced by a sharp analog filter. You can demodulate AM, ISB, or SSB with equal ease, and equally good results. It'll even demodulate NBFM. All you need is to write the proper firmware to do it. No additional hardware, or hardware changes are required.

I don't think that this is an ideal CW contester's receiver (though with on the fly quadrature correction it might be). But it is an excellent receiver for experimenting with digital modulations. And it has wonderfully clean audio as a voice receiver. You could easily spend ten times as much and not get as good a receiver as this one for those purposes.

Consider making your own diode ring mixer. It isn't hard, just
tedious, to match the diodes and wind the transformers for
best balance. MiniCircuits does it for you, but if you can't get
their parts, you can make them yourself.

Or you might want to consider a reciprocating mixer. That
lets you use a LO of half the normal frequency, IE 202 MHz
instead of 404 MHz. That makes things a bit easier too.

Hey Mezgie

That was quite a bar room brawl on 3950 tonight, no??? The Field Mice got their tails caught in the mouse trap.

Now it's 4.30 AM and guess who shows up on 3950????

None other than W5VVI, playing suck-butt with Side Car Sidney and Knothead Don Smith. Lying as he usually does, he's claiming he missed everything on the radio tonight. Says he just got up, and doesn't tape anything on 3950 anymore.

Hey, if you believe that, there's a replica of the Brooklyn Bridge right out here in Southwest Missouri you can buy real cheap.

Norm just finished blaming me for the current state of affairs on 3950, that I started it all. Everything was fine and dandy on 3950 until I showed up and caused all the trouble. Never mind I've bee off the air for nearly 2 years, I'M STILL RESPONSIBLE.

What a bunch of crap. Well, if hams are bored with what they're doing on their usual frequency, they can alwasy tune 3950kc's, 10PM Eastern time every Saturday night for hysterical entertainment, nonstop jamming, nonstop finger-pointing, and limitless foolishness from the Blowhard of New Mexico, K5BLB.

I didn't get around to my post for Kevin Alfred. No big deal. He's ok, but he's just got too fat a head is all. A little dash of humility would go a long way. If he helps tie Sidney's tail in a knot, then that's good. Do you remember when Vic and the Girls used to play footsie with Dave and Norm?? They thought they could appease the Devil but, as MUR said, ""IT JUST DOESN'T WORK THAT WAY"".(got that on tape, by the way). Gee, who used to say that all the time """I GOT IT ON TAPE"". Right you are, none other than W5VVI (vivacious vindictive idiot), colleague of WA9KJI, King of the Jammers. Yessiree, W5VVI, now on 3950 as I write this, bitching about jammers, whereas for ten years, he has defended the worst jammer throughout the entire history of ham radio, WA9KJI. Sort of sounds like the pot calling the kettle black, no??? Yessiree, WA9KJI, who has jammed 3950, 7250 and who knows what other frequencies with his tape collection, probably a lot of it made by none other than W5VVI. And they want to bitch about jammers, that everyone that disagrees with them are Nazis. N5OUG says tonight that you're all Nazis. You're not supposed to criticize the government for running us into a 4 trillion dollar debt, causing numerous wars, etc. I guess the public should just be happy for all this crap and

enjoy it. If you complain about anything, YOU'RE A NAZI.

If you recall, I tried to explain a few things to you back in 95 or 94 about W5VVI. If you think this guy is benign, think again. What's going on right now proves otherwise.

ah yes, isn't the world interesting?

Catch ya later mezgie dog.

Some additional material has just been added to Novice Notes Online.

Most significant is a new Amateur Radio Ideas page. This contains technical hints and other ideas on getting the most from amateur radio. New material on a novel direct conversion receivers, working HF from a handheld and SSB repeaters has been added.

As well, Novice Notes Online contains many articles on various facets of amateur radio and contains much hard-to-find practical information on many aspects of radio.

The same happened to me with a -- 520 once, and the wizard who
fixed it said it would almost always be in the tank coming off the finals,
most likely in the coil just after the final, that separates the RF from
DC. Second choice would be a resistor in the same circuit that biases
the final.

Sure 'nuff, that was it.

Hope this helps.

>isn't that big a deal.)

In your "youthful days" the capacitors in question were not
as old as they are now. I recently decided to replace all
the paper capacitors in an old radio that was working
marginally. I used the modern polypropelene type. The
radio now works as good as new.

I then tested all the removed capacitors on a capacitance
bridge. All were leaky. Some were so leaky that I could
not make the bridge balance at all. On the remainder the
balance indication was broad and fuzzy as seen on the green
eye indicator. New capacitors tested with sharp and well
defined indications.

Throw the old capacitors away.

Normally, the Q. I have purchased 4434 KHz crystals (Mostly manufactured years ago) that have Q's in excess of 100K, a few in excess of 200K. These days, now that the quality control people have taken all the quality out of crystal manufacturing, it's nearly impossible to find one (Usually Chinese manufacture) with Q values in excess of 25-30K. Almost as bad, is the lack of "spread" in the new generation of crystals. For a ladder filter each crystal (Well, each pair from each end) needs to be on a slightly different frequency to make all the mesh frequencies identical. You normally accomplished that by taking advantage of the manufacturers tolerance and selected the proper pair for the position involved in the filter. With modern probably computer controlled manufacture, the darned things come out with just enough Q to oscillate in a circuit, and with no spread at all. I have measured one hundred 9 MHz clock crystals, (Chinese) and not found 20 Hz difference in the entire batch. You can make roofers out of these, or a reasonable noise bandwidth limiting filter, but for a CW bandwidth ladder filter, you're gonna wind up with a filter with over 10 dB of insertion loss with crystals of under 75 K Q factors. I'm kind of partial to my homebrew 5.2 MHz 18 pole Chebychev filter with a shape factor of 1.18 to 1 (Yes it would ring, actually, it does a little bit, but it's a 2300 Hz phone filter) over 100 dB ultimate skirts (Installed) and 1.7 dB insertion loss. There's not a crystal in there with Q under 200K. (It's also 9 inches long and in a copper box inside a steel box, but who's counting?)

What little solid state stuff I got (like my head) still uses the
same laws as usual. The transistors get biased, the RF
still gets separated from the DC, and there are still tanks
and other circuits in the system.

Or do you get yours from aome mysterious oracle?

Sheesh.

I am also having trouble with my 850S , it turns on and it runs thru the series of announcement beeps in cw then, is just in a state where if i move vfo the cw announce sounds and it will displaly a frequency, when it just sit there the freq display shows .....khz , until i move vfo or turn any knob on it then it shows a freq, but no output or being able to hold on a freq all the while the cw tones sound at every movement of dial. I have tried to reset it , how about lith battery in it?.. Also anywhere to have this unit fixed besides Kenwood???

> _) (_/

You might be surprised. My "youthful days" were in the late-70's/early
'80s, working on radios from the '30s and '40s. The 25-year-old paper
caps the poster was referring to are practically brand new by that
standard, especially as they've never been exposed to

temperature/voltage extremes or other harsh operating conditions.
They're likely to be just fine (although whether they'll still be "fine"
in another 15 years is open to question.)

The only meaningful test of a component has nothing to do with fuzzy
indications on balance bridges or anything else. It is: "does it work
in the circuit?" Maybe it was just the favorable climate in my area,
but I seldom if ever had trouble with leakage in paper caps. It was
always the p/s electrolytics that caused trouble, more than anything
else.

3931. Vfo coil design query

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-12 00:00:00 UTC
From: "Roger A. McCarty" <rmccarty@earthlink.net>
Message-ID: <6gqulj$2s5@chile.earthlink.net>
Source record: 83994

Is there any advantage in the size of wire chosen in winding the L component on a ferrite core? That is, is there a stability difference when using smaller or larger gauge wire?

Also, Row Lewellyn suggests "annealing" the coil by boiling it in water for a few minutes. What does this accomplish?

Thanks

Roger KD6CC

Rob,

DSP indeed offers many advantages. It is possible to do
things in DSP that simply can't be done in the analog world.
It is NOT a "passing fad" but the future of electronics.
DSPs are being used in all sorts of communications, control,
and even consumer applications.

If the capacitor isn't charging or discharging more than a fraction of the voltage across it, the current in and out can be approximated as constant. Then,

V = I * t / C

so

C = I * t / V

where

V is the ripple voltage in volts
t is the time it's being discharged, in seconds
I is the discharge current in amps
C is the capacitance in farads

For a power supply with full-wave rectifier and capacitor-input filter (pretty much universal for the kind of supply you're describing), t is 1/120 of a second (for the U.S.) = 8.33 ms.

Suppose the highest voltage you want out of your supply is 15 volts, and the transformer/rectifier can supply 22 volts peak at 2 amps. And suppose that your voltage regulator requires 3 volts of "head room" at 2 amps. (This is the required minimum voltage between the regulator input and output.) Then the voltage at the regulator input can't drop below 15 + 3 = 18 volts. You have 22 to work with, so you can tolerate 4 volts of ripple. (That is, the voltage across the capacitor can droop 4 volts between charging pulses from the rectifier). Using the equation,

C = 2 * .00833 / 4 = .00417 farads = 4170 uF.

This calculation doesn't include any safety margin at all; a conservative design would allow for operation at the lowest expected line voltage, changes due to temperature, tolerances, etc. But this shows you how to do the calculations, so you can make your own choices.

There's very little difference in using different wire sizes, except that the wire should be small enough to conform reasonably well to the core shape, and shouldn't be so large as to require more than a single layer. (See "Choosing Wire Size for Toroidal Inductors", Technical Correspondence, QST, April 1983, p. 39.

I got the "annealing" idea from Wes Hayward, W7ZOI, for treating VFO tank inductors. This process reduces the temperature coefficient of the inductor. It's speculated that the improvement is due to relief of stresses, but I don't believe anyone knows for sure. Both Wes and I have confirmed that it does indeed work. It isn't useful unless you require extreme temperature stability, as in a VFO tank inductor.

The coil I built for junior high science fair used a piece of plate glass with tin foil glued to each side. Don't know the value, but it worked with a 12KV neon sign xfrmr. The plans were from an early sixties popular electronics. GL and don't burn down the place.

Thank you, Roy. And sorry 'bout butchering your name! :-}

The question came from my recent build of a Sieler VFO (Solid State Design pg..35) for 80 meters. The wire I used is larger than an associate recommended (hair like) and I thought perhaps the significant change temperature had on the circuit was due to the larger wire. Quite literally walking into the room would cause a sudden but slow drift. Blowing on the inductor has an extreme effect. I am quite sure it is only the inductor because isolating and moderately heating/cooling the capacitors has a reasonable and expected effect.

I built the "Optimized QRP" rig a number of years ago, prior to knowing what I was doing :-}, and followed your suggestion precisely in the preparation of the toroid. Seemed quite stable as I remember. Perhaps I'll give it another try with this rig.

You might get away with inserting a logarithmic term in the AGC path.
However, like you I think I'd put it into the RF path at least partially. Placing
it in the DSP requires too many bits of precision for my tastes.

Yeah, but as I get older I get lazier. I picked up an "attitude" from my
programming
work. If I have to do it once, I do it. If I have to do it many I program the
computer
to do it. AGC becomes a "program the machine to do it." (One potentially
interesting
approach that should probably be resurrected is the multi-loop AGC with the tap
for a front end attenuator taken off some extra IF gain on an upconversion front
end.
But that isn't "R2". {^_-})

> You do get brick wall filtering that does not ring by using the DSP. You can

And here is the statement that raised this comment. Gary, i just GOTTA quibble
with you here. Analog filters and many types of DSP filters ring up clean and down

dirty. Some types of surface acoustic wave filters and DSP filters ring symmetrically,
they ring up and down about 1/2 as much as the others ring down. This can be a definite advantage. But the ringing is still there.

> properly.

With a finite FIR filter you cannot get brick wall. But you do get sharply bounded time domain responses. You do get some ringing response, nonetheless. It just dies away at a specific time relative to the excitation. By the time you get to a real brick wall response, which requires just a whole LOT of stages (8 stage IIR can do as well as a 52 stage FIR for example), you get "ringing" that lasts as long as the total number of stages times the sample rate. Some of the response happens before the main response gets through and some after. But it does do its obligatory dipsy-doodle if it is going to act like a frequency domain brick wall. Of course if you have documentation that says otherwise I'd LOVE to see it since this is a response to die for.

(And when you start applying filters to the audio ranges you discover some of the more interesting implications of the full 6 terms of the bi-quad filter design. {^_-})

> I used to think that making sonarbuoys was like making TVs and then
> throwing them in the sea.

We didn't make the sonobouys. We just made the S3A sonobouy receiver.
Some 31 channels of RF with a wide band audio multiplexer to some 16
channels of audio output.

We used a pair of filters to achieve the full selectivity. I had NO illusions
about trying to get that much filtering into one filter reliably. (The close
to 15 years of ham radio experience overlapping the 3 years of "professional"
experience at that time saw to that. {^_-})

It went something like:

RF preamp - splitter - RF amp - mixer - filter - amp - filter - amp - demod.

I have built KC4ES's level converter (QST 9/91) and it is working just fine. I have also installed the 8251 and 4040 chips on the computer board in the rx. I can trace the signals from the computer all the way to the rxd pin of the 8251, but I get no signals out of the 8251. The clk pin on the 8251 is always high (i.e., no clock signal is present).

Is there a jumper/diode/resister that has to be added/removed when the computer interface is installed? I would appreciate it if anyone who has added the factory interface kit could provide me a copy of the manual that describes the installation and other details. I already have the command set courtesy of Rob N7ATM. Any assistance would be greatly appreciated.

>

That analogue filtering has just had to suppress an image, not adjacent channels, and the IF could be quite low. The demands on ADC and DSP are a little more than digitising at audio, but the fierce demands on channel matching for a phasing structure are made easy. I think it's still a worthwhile net gain.

Some old HP telecomms instruments covered a few kHz to 35MHz. Up converted to a 50.01625MHz IF with a good xtal filter in it, then down to 15.625kHz.
That 2nd IF is well within the range of 48kilosample/sec digital audio converters, and the processing demands are likely to be easy for current DSP engines. The choice of IF ment a 50 MHz 2nd LO, and a 1/64 MHz carrier osc.

I'm kicking myself for throwing some old boards away a few moves ago. I'd shift the first IF a little, and opt for a 12kHz IF at 48kS/s which allows some nice tricks in the DSP.

Cheers

Several years ago I was in a team that was starting to investigate a
similar approach of self-adjusting correction of gain/phase imbalance.
To allow for variations over time and temperature while sitting staring
at a fixed frequency, thinking was in terms of dual systems, one
working, one being characterised at any one time, that periodically
swapped over. We were diverted into a different project, just after
starting, much to my disappointment. Such is life, but it's nice to know
that it would have worked....

Many Thanks,

Indeed so!

Look inside some of the radios and test-gear using complex I/Q
modulation and you'll likely see variable phase shifters controlled by
phase detectors. This method gets around all the phase lock acquisition
problems, and can be integrated onto a single IC.

> I'd be much more inclined to build a single PLL synth running at
> 4x the desired LO, and use a divider to get the I/Q LO signals.

It works fine at low freqs, but above MF, the prop delay imbalances in
dividers start to become significant and the phase detector/shifter
becomes the most popular method. There's a lot of work going on for
direct conversion radios for digital cellphones, if you look in the
trage magazines.

Cheers
David

Its a common failing among xtal production lines to add another cleaning
process every time the yields drop.
Every year or so you have to go in and prune the cleaning process.
The knack is not to get the quartz/piece parts dirty in the first place
which is an impossible target but sets thinking along the right lines.

I don't believe that hot water is hot enough to take the hard out of hard drawn or "work hardened" copper wire, perhaps it is. I like to just take my variac and crank enough current into the wire after it's formed to get it hot (usually look for 400-500 degrees on the thermocouple if everything else will stand it) and then let it cool. Hard drawn copper wire only has 60 percent the conductivity of soft drawn wire.

If you actually measure the Q of the completed toroid, you can get an appreciable increase in using a wire diameter tha allows a bit of space between turns at the inside face of the toroid, thereby reducing the turn to turn capacity and the "proximity effect", (non-uniform current distribution in the wire). A wire size selected to "fill" the space available, does not yield the highest Q. (I've heard of more is less, but in this case, less is more).

The Professional Partnership Program is a site-license providing an unprecedented level of electronic simulation and synthesis capability at virtually no cost per user. For a one-time investment of $975, the Program provides to every engineer and designer company-wide:

Nodal Circuit Analysis with True Two-Node Port Definition
Unconstrained Noise Analysis
Transmission Structure Synthesis & Analysis
Over 40 Single & Coupled Topologies
Strip (Planar) Structures
Wire Lines
Coaxial Arrangements
Waveguide (Non-TEM) Topologies
Passive Filter Synthesis
Lowpass
Highpass
Bandpass
Prototypes
Practical Reactively-Coupled Realizations
System & Receiver Design Support
Link, Terminal & Radar Analysis
System Architecture Characterization
Spurious Analysis
Transmit & Receive
Coincident & Tuned
Preselector & Output Filtering
Phase Noise Analysis
Time Domain Effects
Frequency Domain Effects

600+ Page User's Manual with Examples & References

Join the Program and you will be furnishing all of this invaluable capability to every designer, not just one! Our competitors are furious with us for having created the uniquely progressive opportunity. It seems they're still using dongles to hinder access to their own products.

Please contact me for additional information. Or, see:

I don't think anyone is using hard drawn wire for making coils, and don't think that the winding process work hardens the wire. But your method of heating should accomplish the same thing as the boiling process.

About 15 yrs ago, I had a drake b line. I was doing some work with a theatrical lighting company, and had a bazillion swatch samples of thier plastic filter material. Almost any shade of any color you could imagine. I used some the the mateirial as filters to make my drake dial illumination any color you could imagine. Finally, I found a color that stuck! I believe it was a light turquose color. This stuff was heat resistant, and i will bet whoever has that rig still has the filter unless he doesnt like the color. I also have some rare General Electric light bulbs in 60 watt soft white for sale for only $5 each. I have some Sylvania units for $7.50Don

>
>W4ZCB

Here are the measurements I made and included in the Technical Correspondence piece I referenced earlier. All coils were 22 turns on T-50-6 cores, measured at 14 MHz.

Wire Size Meas. L Meas. Q
(AWG) (uH)

21 2.10 252
22 2.17 237
24 2.17 250
26 2.07 248
28 2.15 220
30 2.13 196
32 2.28 182

from which I concluded "Within the accuracy of the test fixture, and expected core-to-core variation, the inductors wound with wire nos. 21 through 26 are the same. There is a definite drop in Q for inductors wound with no. 28 and smaller wire, but even this drop in Q won't be noticeable unless the inductor is used in a critical application, such as a VFO tank or a high-Q filter."

It would be helpful if you would post your measurements, to help determine under what conditions the wire diameter is and isn't important.

From: Tom Sedlack <cts050@lmpsil02.comm.mot.com>
Message-ID: <6gts15$fn5$1@trotsky.cig.mot.com>
Source record: 83936

I am looking to build a 2M FM receiver and have a question regarding the L.O. I was planning on using a 10.7 MHz I.F. so my L.O would be 154.7 to 158.7 MHz. I'm trying to come up with a VCO that will cover this range but not much past it, i.e. ~8-10MHz for Vctrl from 2 to 4.5VDC. I would like to keep this design spec as I would also like to keep the PLL loop filter relatively simple.

I am only to the calculating part of the VCO but the way I'm figuring, using a 0.56 uH L and a 2pF C, my tank resonance will be in the ball park at 150MHz. The problem lies in that using some guesses on capacitance off reverse biased diodes, my MHz/Volt values are ~33MHz. I've looked at using varactor diodes in a cathode to cathode configuration to try and decrease this slope but the values available are too high. The values I'm guessing on are using standard signal diodes as varactors to get the lower capacitance.

My question is how do the "store bought" rigs do this? Am I all wet with my calculations? I'm using 1/(2Pi*Sqrt(LC)). Should I re-think my I.F.?? If so, what other ceramic I.F. filter freqs. are available.

Any and all help is appreciated!

Tom

Well Tom your LC ratio is a bit off. Try higher C, Lower L.
You would like to "swamp" out device, stray capacitance changes
over temperature as a start. The Vari-Cap is only part of the
total circuit capacitance. Instead of 560nh try 56nh, then C is
around 22pf. Then calculate the upper and lower resonances for
Min/Max capacitance of the diode over tuning voltage range.

Once you get ready to design a PLL see my Web Page for
free design software.

ExpressPCB makes prototyping electronics with printed
circuit boards easy and inexpensive.

Here's how it works:
1) Downloads their PC board layout package for Win95.
It is available at no cost.

2) With this very easy to use software, design
two layer boards with plated-through holes.

3) Order your custom boards using the "Order Boards
Via The Internet" command directly from the layout
program.

4) Within 2 or 3 business days, an overnight courier
delivers your boards, often for under $100 plus
shipping.

For all the details, check out: http://www.expresspcb.com

Source record: 83856

I've had quite a bit of experience using DC receivers without AGC, and briefly experimented with applying AGC to one. All my comments refer to CW operation, and may not be valid for SSB.

For casual operating, I find AGC to be unnecessary. The ear has a good dynamic range, and it's not much trouble to manually adjust the gain. If you value your ears, though, you should have some sort of limiting on the maximum audio level possible.

One of the uses of my homebrew receivers is Field Day. I've found AGC to be a very definite advantage for this kind of operation, especially on 20 meters and other really active bands. I currently use a superhet receiver with 400 Hz audio filter and very tight AGC, and find it just about ideal. For that matter, I'm not generally bothered by the image response of a simple (non-phasing) DC receiver for casual operation on the less busy bands, but it's a serious disadvantage in a Field Day or contest environment.

One person commented about the difficulty of using AGC with DSP. I found the same problem in using AGC with a DC receiver having a decent audio filter. The delay through the filter is great enough that there's no way to get a decent AGC system transient response if the filter is in the loop. The only good solution I can see is to put the audio filter as early in the gain chain as possible, then apply AGC only to the audio stages following it. (I haven't had the time to see how this works in practice.) I'd think this would apply to DSP systems also, but it wouldn't give you automatic adjustment of the signal levels entering the DSP. I think you'll be able to include the DSP in the AGC loop only if you can keep the DSP delay down to a small part of a cycle of the highest-frequency AF you want to listen to.

Including an AF or DSP filter in an AGC loop would probably be easier with the wider bandwidth filters used for SSB, but good transient AGC operation might still be difficult.

Franky...You mentioned that your keyer is home built. I wonder if the 2 DAH's you talk about are ONLY on the first time the dash paddle is pushed? In other words, you can only send 2 dashes or 3 or 4 etc but not 1? If so, it MIGHT be a situation where your design has dash completion but an initial time constant is longer for the first dash. I've found a similar problem building simple 555 keyers where the chip is powered up each time the paddle is closed...the first dash is longer due to initial charging time being a little longer (the dot is also but is so much shorter that its not noticed). Just a possibility.

Hi N0UU,

I have played with the Kachina radio, on the air on CW, at the San Diego HRO store. It seems to me rather expensive for a transceiver that relies completely on a host computer for total control and front panel display. The "CRT front panel" was more intuitive and easier to use than I thougt it would be, however. But that CRT sure takes up a lotta room, so the combination of computer/separate radio box/CRT is a big one, and expensive.
One thing I definitely did NOT like was changing frequency using up/down arrow keys! They have to fix that. A "knob" is desperately needed. Lastly, they need a keyer input, as I am not partial to being slaved to a keyboard and CRT screen to work CW. (One-handed keyer operation and direct-to-brain reception is hard to beat for comfort and flexibility for competent CW ops).
Just a couple of thoughts...

>It is certainly more than a passing fad. FIR filters *do not ring* at all,
no matter
>how narrow they are.

This is not true. Use any of the various FIR filter coefficient
generation programs and generate coefficients for an arbitrary
brick wall filter. You will see that if you plot these coefficients,
they form a sin(x)/x distribution. This is the impulse response!
Now generate new coefficients for a narrower filter. Keep
doing this for several filters, making them narrower each time.
The sin(x)/x function gets closer and closer to a sine wave
as the filter width approaches an impulse function, as you
would expect from Fourier theory. As you are seeing the
impulse response approaching a sine wave, you are seeing
the "ringing" get worse and worse. There is nothing magical
about FIR filters that allows them to get around basic Fourier
theory...

Now of course FIR filter coefficients can be mathematically
tailored (windowed) to help lower the ringing (at the expense
of frequency response...), and ringing can be eliminated by
using Gaussian filter coefficients (remember that a Gaussian
function has the interesting property of being Gaussian in both
the time and frequency domains...). But in general, your
statement is not true.

Has anybody had an experience using a 2m bandpass cavity on 440? Seems like it should work so I hooked it up to an IFR 1500 and looked at it. Looks about the same on both bands with similar insertion loss figures. The skirts on the 440 side are a little steeper. Am I missing something here?

>Quiote (sp?) and I can dream anyway! Or spend 2K on the new Kachina,
>but what's the fun of that?

It's generally spelt Don Quixote.

I am very interested in hacking together one of these R2 w/DSP backend
radios for playing around with. It's been quite a while since I priced
development boards, or tried to find suppliers. Does anyone have a
current supplier/price for the Motorola, Analog Devices or TI boards that
are willing to sell in quantity one?

I've been playing around with doing simple audio processing just using
the SoundBlaster 16 in my FreeBSD Pentium 166 system. Unfortunately
most drivers are not really setup to do timely full-duplex audio. The
SB16 is particularly poor in this regard, as it can't even do 16-bit
full duplex (one of the input or output channel has to be 8-bit). It
might be possible to figure out how to make this work, but it would
probably be less work to make a dedicated DSP do it, even given the fact
that some assembly language programming would be required.

My current program effort attempts to suck in an audio signal, perform
some filtering (currently a simple 64 tap feedforward) and output the
resulting audio. I have enough time left over to calculate the power
spectrum via an fft and display it on the screen. Timing issues make the
overall program work slighly less than optimally (you can hear slight
pauses or pops as each write occurs). Far from ideal, but lots of fun. :)

Great thread, keep the ideas coming.

Hi,

I just aquired a pair or MRF157's and would like to construct a 1KW amplifier. Does anyone out there use such an amplifier. I am very interested in exchanging information with other users of this transistors. I have read the QST,September 1992 as well as the RF Design articles. Please email me directly so we can chat. Thanks for all the help.

It is great possibillity that it is the T4 in the output, but it could also be an problem with the circuit that mesure the SWR. If it "detects" a great SWR then it also turn down the power. Then if you have the TS-850 it could also be the AT unit but that is easy to check. Just switch it off. Then you have all the relay in the filter unit. Then check if the problem is on all band or just on one band. That eliminate the filter unit.

Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

Only one week away....
The season's first...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 19th, 1998
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

Sellers Season Passes are again available until
April 19th for only $50 per space for all 7 meets !!

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all

sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

> Douglas Dwyer

Typical CW data rates are a little low for most SAW technology. You need a VERY long delayline to get those kinds of delay and bandwidth. You'd also want machine keying to match the SAW filter's precisely. (Or use them backwards at the transmitter.)

Add me to the list. Is there any literature around about this?
If You short the receiver input for a short period (long enough for the analog circuit to settle to a stable state, short enough to keep information loss negligible), can You get all information needed to correct the imperfections of the analog front end?
Phase imbalance of the quadrature LO could be measured separately using, but what would You need to measure amplitude imbalance and DC offset? A shorted input doesn't seem to be the most brilliant idea...

Does it? I assume, that the front end is not the limiting part of the receiver, i.e. it can handle the signals without distortion.
Assuming the lastest high-end audio A/D converter from Crystal Semiconductors (the CS5396) we have 120dB dynamic range at a bandwidth of 22kHz (fSample = 48kHz) or 44kHz (fSample = 96kHz) and a THD of > 105dB. The raw data comes as 24bit serial stream, which could be computed using 32, 48 or even 64bit arithmetic (depending on the DSP used).
We only need a fraction of the bandwidth the A/D converter can handle, assuming a CW bandwidth of 500Hz (not particularly narrow), we can further enhance the dynamic range using 88 samples to get one output sample (44kHz / 88 = 500Hz, DR = 120 + 20*log(88) = 158dB !) This sounds odd and I don't think can be reached in reality, but a DR of about 130dB seems to be reasonable.
Using these 130dB with a minimal DR of 20dB for resonable quality of the

audio signal we still have 110dB to play with. Because the front end and
the A/D converter can handle all signals, we don't need AGC there. AGC
can therefore be done conpletely in the DSP without the delay problems
of external AGC amplifiers.
I think the most difficult part of such a receiver will be the front
end. Making a pair of mixers/amplifiers/diplexers with matched data,
handling signals with a DR of >130dB is everything but trivial.

> > The lack of AGC doesn't really bother me.
> > I don't wear headphones while using this receiver, however. That could be painful at
> > times.

This is the reason, why I would like to have AGC for a high performance
receiver. A no AGC DC receiver is perfectly ok for QRP, but not for a
high end system, where You expect some comfort.

Best 73

You seem to be confusing "high performance rigs" with "rigs with lots
of bells and whistles 'features'" ... the two are not necessarily mutually
exclusive, but neither are they the same.

Rob, you apparently think that all those robots were supposed to have
legs and heads, right? Go have a look in your kitchen, your car, your
laundry, your TV set. You have robots all over the place - you just
don't recognize them because they don't have the legs, arms and head
you saw in the Sci-fi books of the '60's. Think about it...

Paul:

I've played with this part in the past, but quickly dumped it in favor of the GEC Plessey KESTX01 IC. Here are some of the things that I found out about the 13156:

you have to be very careful when tuning the VCO tank, as the detector is just an XOR gate and not a full-fledged FLL/DFF detector. So it is possible to lock up at the extreme 'edge' of the VCO tank and still not be on frequency.

you really, really, need to use the circuit with the external transistor (PD buffer/amp) to get reliable operation. Why this wasn't done right on the chip in the first place, I'll never guess.

I really hated the Moto demo board and just made my own. It was much more prone to operate than the demo board. Just remember that this chip is internally a "positive ground" and so you need to use VCC planes, especially beneath the IC if possible.

You may want to take a look at the KESTX01 IC. It has an integrated VCO tank, so the only external components are the 1/64 Fc crystal, the lead/lag loop filter, and a resistor the set the output power. If you need to do FM, you can do it similar to the 13156 and inject it into the VCO CV line. I have made several "RF source" boards with this IC and find it extremely easy to use. I use a Toko balun on the output to go from the approx 1K output Z to 50 ohms, and get right around -10 dBm or so. Email me if you want more details on this.

Not necessarily so. So called "varactor-less VCO's" have been around
for a while. With careful selection of BJT, they can cover many MHz
if desired. There was a really good article by an engineer at R.L
Drake several years ago in one of the trade magazines that discussed
the design steps of a VLVCO that covered approx 100MHz.

A mere 70 kHz of deviation can be obtained easily, again, if the right
device is selected.

4008. VFO Design

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-15 00:00:00 UTC
From: "Roger A. McCarty" <rmccarty@earthlink.net>
Message-ID: <6h1nle$aco@chile.earthlink.net>
Source record: 83875

Can someone refer me to a resource for choosing the capacitor values in a VFO?

I have many books, but I am either missing the information (as in, not seeing it) or it does not exist. All of them suggest types of capacitors but I have yet to find data/formulas for picking the values.

For example, If I wanted to use a Seiler VFO on 30 meters, How would I choose the capacitor values? It is not exactly a simple parallel LC tank where you could pick L and C fairly easily. There are parallel and series component reactance's to consider. What am I missing?
(besides the ability to think :-])

Hi there,

I'm looking (for the IF - 21,4 MHz - section of a 23 cm repeater) for
an IC which would be capable to deliver something like 90 dB gain with
AGC (This repeater is linear). So far, I have used two cascaded MC 1350
but they are very difficult to trim and tend to oscillate fairly easily.
Does anybody have any clue ?

Thanks and 73s

AD7800 ???
Do you mean AD7008 ?
For new designs ,the AD9830 & AD9831 are better,
later generation & lower cost rather than the AD7008
which is getting a little "long in the tooth".

It sounds like you are getting RF into the keyer circuitry somehow.
Either through an RF ground problem or directly through the keyer
control lines.

I had a similar problem with a keyer that I built. It used grid keying
and often had erratic behavior when transmitting. I designed a circuit
that used an opto-isolator and a power mosfet to interface to the
transmitter and that put an end to the problem.

Putting RF filters on the keying input circuitry might help if RF is
induced into the cable between the key and the keyer. Also look at
filtering the power supply lines as well.

As far as RF grounding... Make sure your rig is grounded well and the
antenna has a proper match. Do you have any RF voltage on the chassis
of the rig when you are operating?

Just some ideas...

Good luck and 73's

>Tnx Frank

You've got RF interference. I'd start by bypassing the keyer wires, wire to the rig, and any other wires such as power supply -- but not mains power --, with 1nF capacitors (keep the leads short!) right where they connect to the circuit or board. If that doesn't work, the next step is to take each group of wires (the three wires to the keyer paddle is one group, the wire to the rig and associated ground another) and wind it through a ferrite core. Use 70-series or type 43 ferrite (low-frequency high-permeability types), and wind with 5-10 turns, close to the keyer circuit board. This should be done with the mains power line also (wind both conductors together) if the power supply isn't separate.

Finally, if you still have trouble, put the keyer into a metal box and bypass all wires except mains power to the inside of the box right where they enter the box. Use the ferrite core on mains power conductors.

There's a really good reason Rick used SBL-1 mixers, which he explained in his original QST article. Second-order distortion in mixers causes demodulation of AM signals. This demodulated audio is amplified by the high-gain audio stages of a DC receiver and shows up as audio in the background when listening. The problem is particularly acute on 40 meters, where there are lots of high-powered AM broadcasters in or near the band. Diode-ring mixers are much more immune to this problem than NE602's or "Gilbert cell" mixers. Some active FET mixers may be as good or better, but I haven't tried them.

Heres how to do it for under $10

1. Use any cad/pcb package

2. Print them onto transparency using a laser printer

3. Iron them onto the copper board

4. Etch as normal, drill as normal

Easy and cheap. I can build a complete transverter for $100!

Hi Pushpendra,

Why does use of NE602 mixers "simplify" an already simple R2? One can't get much simpler than a double-balanced diode mixer, especially considering its excellent dynamic range. And, if you are not interested in higher frequencies than mid-HF (using it for an I.F.), then the noise figure is entirely adequate as-is. The only advantage I can see of an active mixer is the reduced LO power required, but you give up the other advantages of a diode mixer to do it.

Just some thoughts..

73,
Don, W6JL

Frank....Having seen your reply to my msg, I'd have to agree with the other fellows assessment....You've got RF interference all right. Metal enclosure is a good idea....BUT....I built one once in a metal enclosure with a homebrew paddle ALSO in that enclosure...and grounded the single to the enclosure....WORSE THAN EVER!!! My station is a good 'worst case" as I'm on a second storey running an end fed long wire with the tuner in the shack....So YES I would recommend a metal enclosure but try to isolate the keyer board from the enclosure if possible...and bypass all external leads to the enclosure or put ferrite beads on 'em (good source is old video monitor boards for some reason).

Have fun...KEEP TINKERING....THAT is REAL HAM RADIO

I think that the Diplexor used to terminate the SBL-1 diode mixers
and 3 transistor audio preamps (can be simplified) or eliminated by
using NE602a.

NE602 doesnt need a good termination !!!

The decreased dynamic range should not be a concern , IFF, it has a
AGC controlled IF amp and IF filters before it.

It just might be a worthwhile idea to try !

In the meanwhile, I am going to complete my R-2 and make
an 455 KHZ oscilator to drive it, and, then lets see
how well it works and how much it improves my reception
when connected at the IF output of my R-390a BA.

Right On!

Hi,

But make that 'Introduction to Radio Frequency Design' by Wes
Hayward W7ZOI (ARRL 1996). He does a job on Colpitts, Clapp, Seiler,
Hartley and crystal oscillators in Chapter 7. There isn't a deal of
info around on this subject and a lot oscillator designs are simply
copies from elsewhere. There is some mathematics in there but only that
which is necessary. As it costs $30, you might try the library first.

From: jeffreyh@Hawaii.Edu
Message-ID: <6h1uch$htp@news.Hawaii.Edu>
Source record: 83893
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro
Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

4027. Solid-state phase modulation for VHF "FM"

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-15 00:00:00 UTC
From: jeffd@MAPSONcoriolis.com
Message-ID: <353534eb.26331883@news.goodnet.com>
Source record: 83894

Hi gang--

I've played around some with simple FM transmitters for 6M based on the Motorola MC2831AP and MC2833. These work well, but it's been tough to control the output frequency precisely.

I was curious if anyone's done any work with simple PM on 6. At the limits of memory I recall reading of a chip that will impose PM on a crystal-controlled signal, but I don't remember the details.

I don't recall whether PM imposes enough "jiggle" on the carrier to be used straight through without frequency multiplication. I've begun to see those little oscillator modules at frequencies within the 6M band, and they suggest a simple, low-power "FM" rig for 6.

(And if you'd prefer 10M, those ubiquitous 14.31818 Mhz rocks and modules double to 28.63636.)

Any suggestions?

the limitations only apply to "operator select" scanning. If you set your scan groups using the
motorola program as "mode slaved", you can have a different set of 16 scanned modes for each
of the 128 available modes in the radio. It requires a lot of forethought, but does open the range of
scannable modes to 128 X 16 (ok, less a bit of fiddling around).

4033. 10.245 or 11.155MHz crystal source?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-15 00:00:00 UTC
From: Alan Tabourian <71203.1307@CompuServe.COM>
Message-ID: <uLBS94Ma9GA.294@nih2naac.prod2.compuserve.com>
Source record: 83900
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.basics,sci.electronics.components,sci.electronics.design

I am looking for a vendor that sells 10.245 or 11.155 crystals as standard parts to use in a radio design to convert from 10.7 MHz 1st IF, to the 2nd IF at 455 kHz.

It seems pretty crazy that this is a standard frequency but I don't seem to be able to find someone who makes this. I would thing that this is a commodity frequency and you would find it in digikey. No luck so far!

Tks for any help.

4037. Crystal Filter Question

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-16 00:00:00 UTC
From: owens@ale.atd.ucar.edu
Message-ID: <6h53su$fl3$1@ncar.ucar.edu>
Source record: 83805

This is a "black box" type of question. Given a crystal filter
of unknown origin and unknown application, is it possible to
determine the impedance the filter was *designed* to be terminated
in? Full lab instrumentation available to perform measurements.

No manufacturer or part number identification on the filter. Trial
and eror testing with various impedance terminations may result in
an approximation, but I'm after a method that would result in
being able to know what impedance the filter was designed to be
terminated in.

No, but like any mixer, it will work better if you give it one. You should also consider that opposite sideband suppression performance may be more difficult to achieve if you are haphazard with the matching of the mixers. To get anywhere near 50 dB of opposite sideband suppression you will need better than 1 degree of phase accuracy. Your job will be that much harder if you have reflections and mismatches all over the place.

>The decreased dynamic range should not be a concern , IFF, it has a
>AGC controlled IF amp and IF filters before it.

If your goal is cheap and dirty, be prepared for lots of fuss factor. The nice thing about the R2 is that it is very predictable and repeatable.

>It just might be a worthwhile idea to try !

>In the meanwhile, I am going to complete my R-2 and make
>an 455 KHZ oscilator to drive it, and, then lets see
>how well it works and how much it improves my reception
>when connected at the IF output of my R-390a BA.

Make sure the IF strip is decoupled properly. You don't want your LO leaking back from the R2 in to your radio. That's what happened to me when I tried to use my R2 with the 70 Mhz IF output on my Icom R70.

Allow me to suggest two articles for further reading: First: October 1997 QST has an article on a direct conversion receiver which uses a VCO built in to an NE602A. Mixer interface was discussed. The article may be of some interest because you have only to take the instrumentation amplifier output and feed it through a low pass filter and amplifier to the VCO for it to lock on to an AM signal. Of course, this receiver included a small loop antenna and was really intended for 30, 40, or 80 meters. However, you could adapt the design quite readily for service on 455 kHz.

Second article is from QST, July 1993. That was yet another cheap and dirty synchronous detector for 455 kHz using an NE602.

Happy Building!

Hi

I sent e-mail to the last-known (to me) address of Doug Hendricks, KI6DS
and it
bounced in my system. ki6ds@pol.k12.ca.us was the address I used.

A 'good' address will certainly be appreciated because I want to notify
him that I mailed my NORCAL QRP Club "2N2222 Design Contest" entry to
him and need to know if he received it.

Does anyone have schematics, stage gain, IP2, IP3, NF Info, etc.
for these receivers, or at least the schmeatic/parts description?

A RF Chain Analysis could be done to find the weak link in the S53MV
if enough info, or educated assumptions are made.

FORSALE -- TINSLEY LABS CLASSICAL CASSEGRAIN TELESCOPE !!!

MUST SELL (or trade) - MAKE AN OFFER!

I have for sale a Tinsley Labs 8-inch Classical Cassegrain telescope, complete with the original German equitorial mount and clock drive. Tinsley produced these fine scopes in the mid 1960s and are known for their fine optical and mechanical properties. They were (are) research quality instruments which are quite rare and retain their value.

In mint shape, they go for around $3000. The one that I have is in very good condition, but needs a few minor items to bring it to "mint", as follows:

- mirrors are excellent, no scratches or chips, and bright. Although very good and workable, a recoating would make them mint.

- clock drive needs an external 12V battery pack and rheostat to make it operational (this is as it was intended). A nicad pack or motorcycle battery would be appropriate.

- A low tripod or pedestal base (about 20" high) and "rocker box" is needed for the equitorial mount to sit on.

- the optical tube has some scratches in the paint and a small dent, which absolutely does NOT interfere with the optical path. Paint scheme is the original Tinsley gray.

Thats about it. I just don't have the time to use this scope and it's too valuable to just let it lay idle.

I'm WAS asking $2150. for scope and mount (and absolutely will NOT sell them separately) but am OPEN TO OFFERS.

The equipment is located in Monmouth County, NJ. For further information, please contact me.

Thanks,

Joe Levantino

Surely it's mostly due to the RF front-end being optimized almost
entirely for NF, with very little attention to IMD.

Zack mentioned the weak 2nd RF amp IC, and there are at least two high-
gain GaAsFET RF stages ahead of that. Also the mixers are driven by an
LO at half-frequency with only about +8-9dBm each (does anybody have
information on the IMD performance of the antiparallel subharmonic
mixer?).

For the lower bands you'd use a much different gain distribution, and
also different types of RF amp (if any) and mixers.

I don't see any strong-signal problems that are particular to the Weaver
method, compared with either phasing or a plain DC receiver. All three
systems use essentially the same RF and lowpass audio system, right up
to the point of demodulation.

Hi Glenn,

Don't know if it is what you may be looking for, but my hombrew ATV Tx data is located on my home page. The address is in the signature below. My design is similar to the AEA Tx (my original drawing dates preceed their release). One neat thing is that with little modification the Tx can be fed from a VCR Ch3/4 output or the same from a downconverter from another band (AGC reccommended).

>If so, what other ceramic I.F. filter freqs. are available.

20 years ago, I designed a commercial 156 MHz marine radio using a
VCO that ran at around 170 MHz. I used a lot less inductance than
you did. The inductor was a PC board trace about 1 inch long.
The capacitors were fairly large to make it tune to 170 MHz.
The varactor was an MV209. If that gives you more tuning range
than you want, you can put several diodes in parallel; however there
is no great disadvantage to having extra tuning range. This
VCO had very low phase noise, about -120 dBc/Hz at 25 kHz offset.

You realize this is almost 2kW PER SUPPLY? You will need a 220VAC line at
minimum
Somehow I don't think this goes well with the next part, "to power a pair of
MRF154 small signal transistors".

Sanity check fail. Reboot universe.

4067. Best omni ant for microsats?

Dear Homebrewers,

Comments are invited regarding successful omni-directional antennae,
to be used on the 70 cm downlink of the 1200 baud microsats.

I have built and tested a lindenblad, a quadrifilar helix and a
turnstile. By far the best all-round performance (as measured by
download volume) has come from the ubiquitous quarter-wave ground
plane, two of which have been built and used both at home and /mm.

The only untried one that springs to mind is the eggbeater. Are there
any published designs around for this type of antenna? Will it provide
me with superior performance compared to a GP over an entire pass?

Unfortunately my housing situation rules out tracking arrays and
diversity setups, I am limited to a single downlink antenna. Any
suggestions for improvements are welcome :-)

<cut>

I'm not sure about the "current in" part, Roy;

If the capacitor is feeding a linear regulator, then the action of
the regulator
makes the current taken from the capacitor independant of the capacitor
voltage, so the capacitor sees a load that looks like a constant-current
sink, with quite a high impedence. - all so long as the capacitor
voltage allows sufficient headroom for the regulator at all times.

If the capacitor is fed from a conventional transformer and
rectifier arrangement, then the capacitor is only charged when the
rectifier devices are frowards biassed. Charge current only flows on the
rising edge of the ripple voltage.
Going to a big reservoir means that the load current will drop the cap
voltage less between half-cycles, so less voltage has to be made up by
the charge current, this means that charging starts later and later as
the capacitor is increased in size, so the time for charging diminishes.
In this way, the charging current is not constant, but is pulsed. With
low ripple, the pulse is on only for a relatively small fraction of
time, and its peak current is much greater than the current taken by the
load.
Over a cycle, the amounts of charge entering and leaving the reservoir
must be equal or else the mean voltage will drift between cycles.

When I've had to design power supplies, and try to get the
regulators as efficient as possible by carefully fitting the ripple
mimina to the regulator overhead spec, at the low mains voltage spec,
and tried to help by using a big reservoir to reduce ripple, I've found
that I had to consider the transformer secondary (and transformed
primary) resistance, and diode drops at the peak charge current, not the
load current.Putting the C up narrowed the charge pulse and increased

its peak current. This acted to spoil a lot of the benefit that I thought I was going to get :-)

If I wasn't trying for a fine-tuned design, I think I'd pick a capacitor value to give about 5 to 10% ripple voltage at the max load current as a rough rule-of-thumb.

Cheers
David GM4ZNX

In this type of service, a lot of diodes are prone to creating RFI by slow turn-on/off. Daft as it may seem, it's worth using fast rectifiers at 50/60Hz to get lower emissions if you have to pass EMC tests, or just want a quiet environment.

Quartz delay SAW for an HF frequency (which affects width) was several
inches
long for a delay of about 140mS. For 1000wpm plus this MIGHT be useful. SAW
is
more often applied to complex modulation schemes like direct spread
spectrum or
chirp spread spectrum with inherent rep rates much higher than 7kHz.
However
other materials may exist that have slower propogation rates yielding
smaller
SAW features.

> W4ZCB

I don't think that it's the wire that's being affected. I believe
it's the core. With a dust iron core, it's easy to look up the curie
temperature of the alloy used, but for very low tempco effects at room
temperatures, the binding material is most likely the chief culprit, and
could easily be affected by a 100 celsius dunking.

Ferrite materials have some interesting juvenile ageing effects, too.
Look up "Disaccomodation" in one of the standard texts like "Soft
Ferrites" by Snelling.

You're correct. The current goes in as short, high-current pulses, and the
current out is constant and equal to the load current. My formula and
analysis were based on that operation and should be correct, although the
qualification I gave at first doesn't, as you point out, apply.

>. . .

An interesting and valid point. What I've seen is that increased drop
during the high current charge pulses simply increases the charging time
each cycle, and hadn't seen it as a problem. But I've had the luxury of
having fairly stiff transformers in most of the supplies I've designed.

>. . .
> In this type of service, a lot of diodes are prone to creating RFI by
>slow turn-on/off. Daft as it may seem, it's worth using fast rectifiers

>want a quiet environment.

That's very interesting. I would have expected fast diodes to generate more RFI, since the harmonic content is higher for faster edges. The only time I've considered diode speed was in switching regulators, where the problem is increased dissipation due to charge storage time. I've never analyzed it, but assumed that the "slower" diodes (the ones with greater storage time) switched off about as quickly when the charge is depleted as the low-storage-time devices, so would produce comparable RFI. (This switching time can be very fast, and is the phenomenon featured in step-recovery, or "snap-off" diodes.) As for the turn-on time, I've always assumed it to be much faster than the applied charging pulse, so that the latter would determine the actual turn-on time. It appears that some of my assumptions aren't valid.

I'd like to learn more about this. Can you briefly explain why the slower diodes give out more RFI?

Thanks!

4076. Regenerative Receivers, More Info

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-17 00:00:00 UTC
From: jshillw6ivw@earthlink.net
Message-ID: <35377fbb.1316644@news.earthlink.net>
Source record: 83840

I stumbled upon KF5ND's query regarding regenerative receivers while searching newsgroups using dejanews (a super search engine). Two interesting books on regenerative receiver design and building are published by Lindsay Publications, P.O. Box 538, Bradley, IL 60915-0538. phone 815-935-5353, fax 815-935-5477. The books are: Secrets of Homebuilt Regenerative Receivers by C.F. "Rock" Rockey and How to Build Your First Vacuum Tube Regenerative Receiver. by T.J. Lindsay. Both sell for around $10-$15 each. The second is not as elementary as the title would suggest, and includes sources for those who don't have old time junk boxes. However, I doubt if the performance of those receivers approaches Robert Key's receivers.

Charles Kitchen's article, "The Lost Art of Regeneration" appeared in Electronics Now, March 1994. If you are lucky, it's available at your local library.

I'm going to look for the Popular Electronics article. Has anyone else found it?

Another good reflector is Boatanchors. It is much more active than Glowbugs. It costs about $20/year, but you can get a free trial subscription that lasts about a month. The easiest method of subscribling to either Glowbugs or Boatanchors is through http://pw2.netcom.com/~ac6v/pageae.html .Look for Boat Anchors with The Porch as part of the address. There is another boatanchors which is primarily buy/sell. In either reflector, start the ball rolling with a query. If you subscribe to Boatanchors, prepare for lots of mail by filtering messages to a Boatanchor mailbox. I did nothing for a while except read the mail, and Eudora finally locked up. I think I filled up my 32 meg's of RAM. I recovered after closing hundreds of windows, but that's another story.

Old issues of QST provide much information. Back in the late 20's and early 30's there were technical articles on regenerative receivers. For example, one article covered all the different methods of controlling regeneration. Each method was tried out (a little like Consumer's reports). I'm attempting to find that article again.
A second article (October, 1934, pg14) was called Tailoring RF Transformers for Short-Wave Receiver actually should have said regenerative short wave receivers. It was written by L. W. Hatry, the ex-technical editor of QST. A third article was Regenerative Detectors, What We Get form them (QST, Feb 1933, pg 26) - How to Get More provides quantitative data. The results are summarized in Lindsay's book (see above). A fourth article, Increased Sensitivity With the Regenerative Detector is in QST, Dec 1934, pg 24). I made

copies of these articles. You need to review each issue of QST, not just scan the table of contents. I found these while stranded in a small town in New Mexico for about a week, waiting for parts to get my truck repaired. Fortunately, I had just picked some more QST's for my collection and took them with me. Old issues of QST will be available after the ARRL completes their CD ROM project. I'm holding my breath. Be sure to look for James Millen's articles that covered the design of the SW-3.

I'm interested in contacting others interested in regenerative receivers or crystal sets.

73's Jim

>
> Eric Prigge

This is a tough area. You need to be a little more specific about your application and specs. You can dig mixers out of spectrum analyzers, etc. that will meet this frequency requirement -- barely -- but they will be too delicate for use in, say, a receiver front end.

The closest thing I've found: For US $90, the Mini-Circuits ZEM-4300MH supports RF/LO signals between 300 and 4300 MHz, with an IF extending from DC-1000 MHz. As with most DBMs, it is possible to switch the LO/RF and IF ports, giving you RF response extending down to DC and IF response to the full mixer rating of 4300 MHz.

I recently used a ZEM-4300MH as part of a homebrew tracking generator, with a +2 dBm 110 MHz LO injected at the IF port, a +2 dBm 2182 MHz signal at the RF port, and a 2072 MHz IF coming out through the LO port. Worked fine even though the LO injection was below spec, but this was a non-critical application with clean signals, fixed levels, and a really nice cavity filter in the output circuit.

Now, still being a complete novice at all this, I have no idea what this practice does to mixer linearity, quantitatively speaking. Your IMD might go straight to hell, or it might remain practically unchanged. Dunno. It wasn't important in my application, but it might be for yours. The Mini-Circuits catalog is not much help on this topic, saying something to the effect of "Generally, the linearity characteristics will not be as good as with the signal connected in the conventional manner."

I plan to order another ZEM-4300MH soon and do some experiments with it to try to quantify the exact drawbacks to running it with the RF and IF ports reversed. I'd like to use it as a receiver front-end mixer, but I'm afraid of ending up with an IP3 somewhere in the microwatts. :-(Maybe one of the resident Wise Old Men with Beards can speak to this topic with authority? Failing that, all a fellow can do is cough up

$89.95 and start measuring.

We have an engineering job opening in our development group here in Dallas, Texas.

We are part of the TIRIS organization, a division within Texas Instruments which develops and markets RF identification systems.

Our particular group develops product for the ARC segment (Automatic Recognition of Consumers). One important target for our products is the oil industry. You might have seen the Mobil Speedpass application, where one gets automatically recognized by the gas dispenser when fueling one's car.

The little electronic RF devices that Mobil issues are developed by us, we call them "transponders". They can either be on your keyring or be mounted in your car.

The devices work through an RF link, and also contain the necessary smartness by means of embedded software.

The associated reader equipment that goes into the gas dispenser is also developed in our group.

The person we are looking for has experience in receiving and transmitting techniques, modulation techniques, antenna theory, and some experience with digital electronics and embedded software.

I believe excellent engineering talent to be present within the world of radio hams. Therefore, if there is anybody that feels he or she fits the above profile, and holds an electrical engineering degree, please send us your resume.

Please send it to:

L.J. d'Hont Mgr development engineering TIRIS ARC segment

Apart from Mini Circuits (who have a www site) you could
take a look at Watkins-Johnson or Synergy Microwave (this
is NOT Synergy Semiconductor!).

On ring mixers you can exchange the RF and IF ports.
This should give you more types to choose from.

And you could build your own, say a rat race ring
with Schottky diodes.

4084. Constructional Projects Now Feature on Home Page

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-17 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <3537d5b8.0@newshost.pcug.org.au>
Source record: 83848
Cross-posted to: aus.radio.amateur.misc;,rec.radio.amateur.homebrew

Practical constructional projects and downloadable pictures. These are the most recent improvements made to the Novice Notes Online/Australian QRP website.

Details of homebrew projects (including schematic diagrams and some constructional information) now appear on 'Peter Parker's Projects Page'. At this stage information on only two projects is provided, however this is likely to change in the near future.

Readers of rec.radio.amateur.homebrew following the 'Unusual DC Receiver' thread will be pleased to hear that a schematic diagram of the prototype receiver is one of the projects featured. The other project is a somewhat novel technique to allow the reception of SSB signals on an AM shortwave receiver, while overcoming many of the limitations of these receivers when used on the amateur bands.

A further improvement has been the enlargement of the 'Amateur Radio Ideas Page' - downloadable diagrams have been included. All diagrams can be viewed on MS Paintbrush - no exotic viewing software is required.

Both Peter Parker's Projects Page and the expanded 'Amateur Radio Ideas Page' are available through the URL below.

Woody:

I sent you a postal money order for $150 on March 31. It was sent by priority mail which should have put it in your hands 2 or 3 days later.

Today is April 17. No package. No email. Nothing.

You mentioned you were going out of town for the second week of April. My money order should have reached you well before you left. What gives?

What do you know about the effect of RF/IF port interchange on mixer performance? I'd be curious to know if you have any further info on that.

The fact that you said that your SWR bridge indicates HIGH (Infinite?) SWR shows that you do have output of some sort....Disconnect your antenna and prove your output and your SWR bridge into a dummy load (with also a wattmeter in line or as part of the dummy load). Do this before even thinking about opening up your radio.....As one reply indicated, it could even be your SWR meter itself...other good possibilities (if indeed you can prove your antenna with another radio or analyzer etc) are shorted coaxial connectors (after the bridge)....tuner (if you use one)...cable pinched or broken or corroded. Last but not least, check your ground connection.....Some antenna and installation combinations are quite critical to the need for a ground or a counterpoise.....I run an end fed long wire from a second storey location and can tell you how critical that is indeed!!!

73 - KEEP ON TINKERING.....THAT....is REAL HAM RADIO!

Also look at Technical Topics from the RSGB. I followed the advice
there and have built several Seiler vfos with the ratio of fixed caps
recommended by them.

Essentially - make the feedback caps six times the value of the
tank and base feed caps. I even wrote a basic program to help.

It gives ball-park numbers. Jim Fisk's article is reprinted
in the Ham radio Handbook if you can find a copy. Essential reading.

Pieter,

Call Fair Radio Sales in Lima Ohio, they had a rack mount power supply
(48 - 50 VDC) originally built for a commercial HF amplifier that should
fit the bill nicely. I was looking at this supply for the same type of
solid state amplifier project that you are building.

Message-ID: <1998041807092700.DAA25028@ladder03.news.aol.com>
Source record: 83760

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...

increasing the wire gauges increases the Q by a small amoun t but it is significant when competing with the best in the world to nit pick every bit of Q out of an inductor. Annealing is to soften metal to take out the memory (spring)in a coil when heating it the metal tries to bend back to its previos position. the overal temp drift is in the ppm/c of the metal of the wire and MORE SO the ferrite core. I don't suggest doing that because you can de Q the core or crack it. Anneal the wire before winding it. or use silver wire which is very soft.

Source record: 83763

not so! I build filters on a daily basis dc to 40 GHz and am competing with and against the best in the world. it has nothing to do with the ratio. In an RLC circuit , if the loss of the inductor is the lower Q of the LC resonator than the cap, the wire always helps the loss providing that you are not using the wrong core material for the frequency range, in which case the core acts more as an absorber and the Q is driven to low to see a difference. The lower Q inductors benefit the most and also the lower the perm of the core. there are many other factors that are non published which can increase the Q but they must remain proprietary for obvious reasons

yes people do know for sure. You are right the stress relief is exactly why.
The temperature coefficient if a metal does not change by annealing but it does
soften the metal and helpa relieve the memory or springyness that willl causes
a metal to try and bend back to its previos position when shocked with hot or
cold sudden changes.iDesighn , temperature test and tune microwave filters dc
to 40 GHz on a daily basis and reasearch metals and ceramics.I have written
software to calculate expanding and contracting combinations of metals
over temp extremes -55 to+ 25 degrees celcius for cavity filters and ceramics.
You may find my toroid program that i have in the market usefull

MCL has some details in their Handbook. The main problem when using the
IF port for input is the direct connection to the diodes, making them
more prone to damage. Doing this enables an input response down to DC.

Looking for a 10 meter FM rig such as an Azden or similar. Physical
condition not important as long as it works ok. Does NOT need to have
a PL tone card since it will be used mainly for simplex operation.
Please state what you have and your asking price please when emailing.
Thanks.

4102. The Real Ham Code

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-18 00:00:00 UTC
From: Burt <burt@innocent.com>
Message-ID: <6ha2ua$40v$2@as1000.javanet.com>
Source record: 83770
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

The Radio Amateur is:
CONSIDERATE...never operates in such a way as to lessen the pleasure of other's. (unless of course it is a contest).

LOYAL...Offers loyalty, encouragement and support to other amateurs, local clubs, and the American Radio Relay League, through which Amateur Radio in the United States is represented nationally and internationally. (unless of course money is involved or in many cases little support shall be given if the ham is old (almost always the case) and the new ham is young).

PROGRESSIVE...with knowledge abreast of science, a well built and efficient station and operation above reproach. (unless of course you have any money the you become an "appliance operator").

*FRIENDLY...slow and patient operating when requested; friendly advice and counsel to the beginner; kindly assistance,cooperation and consideration for the interests of others. These are the hallmarks of the amateur spirit. (unless of course it is a flea market (every man for himself).

BALANCED...radio is an avocation, never interfering with duties owed to family,
job, school, or community. (this is rarely true. A good contester will leave the family on Christmas if there were a contest, a local kid, known as "The breather" sits by his "hamradio" day and night talking to anything that comes along except of course a girl. Finally the only thing most hams will leave their "ham radio" for is a cup of C O F F E E.

PATRIOTIC...station and skill always ready for service to country and community. (unless there is DX around or a contest, in such cases it is accepted to ignore any emergencies).

Please visit my World Wide Web Site, you have never seen a page like it.

February 20, 1998
Dear President Stafford,
You have not responded to my letter of September 27, 1997 where I questioned why I was removed a VE. I have not violated any provisions of 97.525 or any other aspect of F.C.C. regulations that govern this hobby. Thus unless you restore my VE status FORTHWITH I shall send the following letter to newspaper editors throughout the country (on a staggered basis). This is a threat. I believe fully in what follows. The only reason I have not written this letter before was I was not motivated to actually send it.

Dear Editor,
There was a time when amateur radio provided a public service in training operators for military service, technicians for industry, fostered international goodwill and carried emergency communications. This rarely is true any longer. The technology has long ago left hams by the roadside. Today amateur exams are so simple children who can barely read can pass the test. All questions AND the answers are published in multiple choice format. The examinee knows the actual questions and answers ahead of time. The average age of today's ham is well over 50 whereas when I was first licensed the average age was 27. Hams are still communicating at 1200 baud when internet users fly along at 40 times that speed. As far as international goodwill, most hams rarely ask a foreign station anything more than what his equipment is, they do not care about culture, lifestyle or anything that really matters. Hams usually want the "credit" for having talked to 100 or 200 or more foreign countries (did you know both Hawaii and Alaska are separate "ham" countries?). If you have a scanner listen to frequencies between 145 MHZ-148 MHZ and listen to the content of the conversation. These are valuable frequencies that other public service and commercial interests could use PRODUCTIVELY. Cell phones have replaced the need for most emergency ham communications in this country. Hams use many other frequencies for little more than a discussion of personal medical ailments. Hams are required to serve the public but in fact they are serving themselves almost all the time. Worse they cause interference to other services (like your TV) and they erect large towers and guess what, there is nothing you can do about it. The F.C.C. is too underfunded to respond to citizen interference complaints and the ham radio lobby (American Radio Relay League) has caused both state and federal governments to pass laws that prohibit towns from controlling these
large antennas.
The frequencies that hams use are for the use of everyone not their personal fiefdom. It is time Congress conducted hearings and investigated whether ham radio has become the vast wasteland (a term that former F.C.C

commissioner Newton Minow popularized).

>and they suggest a simple, low-power "FM" rig for 6.

The circuit you want is called a reactance modulator. This works by
varying the tuning of the LC tank of an amplifier stage following the
oscillator. The amount of deviation you can achieve is very small
so you need multiplier stages after the reactance modulator, usually
at least 9x for NBFM.

Since direct FM of a crystal oscillator is so easy with a varactor,
there's not much point in using a reactance modulator and PM
anymore unless you just can't modulate the master oscillator for
some reason. And in that case, you'd normally use a PLL, and
directly modulate the VCO of that via the error loop, anyway.

You can frequency modulate those little can oscillators by
varying the supply voltage. It's kind of nasty, you get AM too,
but it does work. If you run it through a limiting stage, you
can get rid of the AM.

I have a couple of VHF mitrek's that are 100 watt models. Was thinking of taking out the PA's and making me a nice 100 watt amp for 2 mtrs. Anyone got the info I need to do this ? I know that I will need a rf sensing relay to take it out during rec. mode . If you can help I would appreciate a schematic . I have a fax - 409-778-8728 or just attach it to a message if you can. Would be less expensive that way.

Following feedback from readers, I'm pleased to announce further
improvements to my webpage.

The main change is the use of .gif images for the schematics and other
diagrams instead of .bmp files. This dramatically reduces the size of
the files (10k vs 141k). Also it is now possible to view the schematic on
line.

Recently added is information on a simple 2m antenna for portable use.
Information on other projects will be added as time permits.

You can get to this page through the URL below.

I could hardly agree more. I quit trying to enjoy ham radio in 1987.
Between 1973, when I became a ham, and 1987, when I packed away my
equipment. I think I had maybe 5 interesting conversations on ham radio.
The absolute, unvarying banality of ham conversation on both the low bands
and two meters never ceased to amaze me. These were presumably intelligent
people! They couldn't successfully pursue such an advanced technological
hobby if they werent! Yet they were as incapable of speaking intelligently
with each other on topics other than their health or their rigs, or of
exercising even the minimum imagination necessary to make human contact
with foreigners, as if they were children--or CBers. It took me years to
understand that this limitation was really an integral part of the ham
experience (I'm a slow learner.) Once I did understand this, I switched to
computers and then the internet, where usenet makes possible occasional
thoughtful and interesting exchanges (in between the cancerously-spreading

sex ads).

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment,rec.radio.amateur.boatanchors,rec.radio.swap,rec.audio.tubes,rec.audio.pro

FOR SALE:

110 watt stereo FM transmitter -- uses Gates TE-1 crystal-controlled transistorized exciter (10W output) driving a modified GE Progress-line transmitter (power-amp only) with 5894 tube output. Includes spare power-amp, new spare tube, setup mounted in heavy 6-foot steel rack. Works well and reliabally. With manual for TE-1. $250, local pickup only.

8-channel Ampro solid-state stereo broadcast console -- four inputs per channel, four channels have gain for microphone input. Built-in 20W monitor amp and muting functions. All inputs are transformer-coupled (nice iron) and use rotary stepped attenuators. Unit functional, needs some work. $150, local pickup only.

Misc. power transformers, mostly with high-voltage windings, most pulled from old tube-type test gear (HP, etc.). Many potted, a few antiques with ceramic insulators. Some look nice, some don't. Free for local pickup.

I'm in the Kansas City area . . . have to get rid of this stuff in order to move. Email me if interested, I don't read all these newsgroups. So there.

Hello Alex,

13 is the age I started in Ham Radio (I'm now 54).

I'd suggest starting with some small kits. The keyer kit is good. TenTec http://www.tentec.com has a number of kits including receivers, etc. Also JDR Microdevices http://www.jdr.com has some small kits of various types. There are plenty of others. Try a web search on "kits" or 'qrp". Digi-Key http://www.digikey.com and mouser electronics http://www.mouser.com are good sources of parts. The ARRL Handbook is a good source of technical information.

>Another way of saying that: In order to keep the ADC within range,
>The whole signal going into the A-D has to be used for AGC.

Arrgh! You're right about that. I *knew* that, but I had forgotten it by the time I started playing with AGC. No wonder my AGC attempts didn't work right. I looked back at my notes from over a year ago when I started this project, and there's a big notation about dynamic range in there which covers just what you're telling me. I think I even posted something to this group about it then.

>Yes I do understand your point....The QRM is also modulating the
>desired signal via AGC if it is allowed to contribute within AGC loop.

Yeah, that pushes weak signals right into the noise floor.

>One idea would be to have the DSP read the AGC control voltage via a
>slow/coarse A-D, It could then scale it's output according to the

>desired signal, and not QRM which dominated the AGC action in the
>first place. In this case, an interfering signal degrades the
>effective resolution of the DSP, but does not change output level.

Uh huh, but weak signals are still gone. That's my primary interest, dealing with weak signals. So I don't want to do anything that buries them irretreivably into the noise. Looks like more dynamic range in the DSP is mandatory for my purposes. I'd figured that out over a year ago, but it somehow slipped my mind by the time I started playing with AGC.

Not really. The only problems are that tuning is touchier when used on 70cm,
and the coupling loops may not be optimium.

Kits are probably the single best way to get started on the practical side of things. While it's important to challenge yourself, it's equally important to take on projects that you actually have a good chance of success with, when you're first getting started. I take it you've looked at the Ramsey web page (http://www.ramseyelectronics.com)?

Once you have gotten the basic theory and techniques under your belt, you can start making modifications and "design changes" on your own. Before you know it, you'll be able to tackle some of the simpler homebrew projects in the ARRL Handbook and similar sources. You don't need a lot of expensive test gear or hundreds of pounds of books to build simple receivers, keyers, and such. Patience and a good sense of personal focus count for more than anything else.

For any more specific advice, you'd need to elaborate on your interests a little more. Are you looking to pick up the basics of RF construction? HF? VHF? Digital logic? ... There are a lot of directions you can go in, obviously, but fortunately it's never been easier to "learn by building"" than it is nowadays.

What books and test equipment (voltmeter, scope, etc.) are available to you?

Hello....
Bob's sugestions are good. Commercial kits are a good way to get some
experience. When you start to "roll your own", it is helpful to have a
well stocked "junque box". Sometimes surplus houses have parts
available cheaper than retail outlets (not always - do beware). There
are a bunch out there. FWIW, I picked some from by bookmarks:
http://www.allcorp.com/allcorp/
http://www.mpja.com/
http://www.controlled.com/surplus.html
http://www.fix.net/dans.html
Also for some neat hightech goodies check the manufacturer:
minicircuits.com
73 and have fun, Woody

I have a small 13 inch portable color tv made by Goldstar. It has developed a problem that is getting worse. During startup, the picture comes on fine, but I have about 1/3 of the top portion of the screen black. As the set warms up, the missing section shrinks in size to about one inch wide at the top. Looks as if someone is holding a black cardboard on the top part of the picture screen. Otherwise, picture and sound are fine. In compairing the same program on my other tv, the complete picture is there, its just not scanning the top of the screen...any ideas?

I am looking for a copy of the 1991 Central states proceedings. In particular an article about a solid state kilowatt amplifier using a pair of MRF154's. Will pay for the trouble of mailing me a copy plua any other costs. Thanks

Pieter

Best thing you can do is get a mentor. Talk to local school electronics
teacher.Try to get a helper job in a repair shop of some kind working around
people who canhelp. Join a club. You'll learn soldering technique and
construction practice from
the better kits, but not much else. Most hams won't be much help. (Boy, am I
gonna get
flamed for that one. Let me hasten to add that technical electroincs people who
happen to be hams
are in a different class and are sometimes helpful.)
That's my experience based on advice I've received here, your mileage may vary.

Simplest, cheapest most useful thing you can do is decide on something you want
to
control and figure out how to do it thru the parallel port of your (PC) computer.

Weather station, robot, CAT radio, TV remote control, WEFAX decoder, repeater
controller,
etc. Check the Microchip application notes for more ideas.
http://www.microchip.com
That simple task will teach you about software, digital interfacing, analog
problems with
interfacing. You'll learn all about the thing you're trying to control.
You'll learn about trying to make it work with hardware that's ill suited to the
task.
You'll learn a lot about analog design without the math.
You'll learn how to find the specs and databooks you need.
You'll learn about compromise.
You'll learn to plan a project and execute it.
Almost zero investment. If you like the result, you
can always redo it with a micro or logic hardware.
Be sure you use a computer with a cheap replaceable parallel port. Don't try
this with
Dad's $5000 Pentium laptop.

Get fluent with Ohm's law. Get someone to teach you the subtleties of simple
transistor biasing.
It's amazing how many self-proclaimed technical people can't apply ohms law or
bias a transistor.

At 13 you probably don't have enough math background to do serious analog
circuit synthesis.
There's plenty of stuff you can do simple rules of thumb. This is one field
where it's ok to be
"all thumbs".
Math skills will come to those who wait....and go to college while they're

waiting.

My advice to a new homebrewer is the same given to me by the older fellows...when I was only 11 and starting into radio....Get some scrap chassis, TV's etc will do...VCR's or old computers nowadays....Strip 'em completely..every part. That will start your junk box with some parts; You'll get invaluable experience in desoldering and disassembling different types of connections; You'll see how things are put together, what's solid and what's not.....yes and an idea what to throw out (you get better as you go!). Start a "wire box".....as you strip chassis, seperate and put the wire into that box...it'll build up and you'll hardly ever build a poor looking project for lack of nicely seperated color codes etc (heck, note that you'll see some common colors for particular circuits). That's my 2 cents worth....heheh...still do it!

The TI C40 family does 32 bit floating point arithmetic as fast as integer.

To prevent out of band signals from pumping the desired signal, you can
feed the AGC signal to the DSP and compensate for it later on. If the
AGC response is non-linear, you can always use a lookup table.

Looking for an inexpensive 2M handheld such as an old IC-2A or 2AT or Tempo S1. Don't need anything fancy. Physical condition not important as long as it works ok. Does NOT need to have a PL since it will be used mainly for simplex operation. Please state what you have and your asking price please when emailing. Thanks.

>maximum audio level possible.

That's sort of automatic with my DSP, IE it runs out of bits and saturates
at high levels. That's why I'd like to have AGC, to prevent saturating the
A/D, not so much to save my ears. I'm a digital operator anyway, so I'm
not likely to be operating with headphones clamped to my ears.

>One person commented about the difficulty of using AGC with DSP. I found
>the same problem in using AGC with a DC receiver having a decent audio
>filter. The delay through the filter is great enough that there's no way to
>get a decent AGC system transient response if the filter is in the loop.

That was me. The delay is the problem. By the time you have an error signal
out of the narrow filter, you already have an overshoot that's overloaded
the A/D. And by the time you detect that more gain is needed, you already
have an undershoot situation. (I may be using overshoot and undershoot
backwards, but you get the idea.) This happens with analog narrow audio
filters, with T=1/B, but it is extreme when using DSP filters because of the
many stages in the filter, each occupying one unit delay.

>The only good solution I can see is to put the audio filter as early in the
>gain chain as possible, then apply AGC only to the audio stages following
>it. (I haven't had the time to see how this works in practice.) I'd think

>adjustment of the signal levels entering the DSP. I think you'll be able to
>include the DSP in the AGC loop only if you can keep the DSP delay down to
>a small part of a cycle of the highest-frequency AF you want to listen to.

No way. Each unit delay is equivalent to 1/F where F is the sample frequency.
If you're using 8 kilosamples/sec, and a 21 tap FIR, you're looking at a minimum
delay of 2.6 ms, or a frequency equivalent of 381 Hz on 4 kHz audio. And a 21 tap
filter isn't all that hot. Total delay through the DSP can be much greater, depending
on the complexity of the processing you're trying to do, Hilbert transfoms, FFTs,
convolutions, cross correlation, etc. The delay through the commercial add on
DSP boxes is enough that you have to bypass them in order to monitor your
CW sidetone. Otherwise the delay badly screws up your sending. Same with
voice operation, the delay will make you stutter.

Feed forward may work to protect your ears, but it does nothing to prevent overloading of the A/D. That might not be a problem with sufficient digital dynamic range. But while A/D converters with enough bits exist, the problem is processing all those bits through the DSP. If you have to resort to arbitrary precision arthmetic routines to handle the dynamic range, you won't have enough speed to handle the processing load. (Of course wider DSPs are becoming affordable, so this becomes less of a problem as the SOTA advances and prices continue to fall.)

>Including an AF or DSP filter in an AGC loop would probably be easier with
>the wider bandwidth filters used for SSB, but good transient AGC operation
>might still be difficult.

The problem is to get good transient response, but not to out of passband signals. If you don't do the AGC with the filter in the loop, you get desired signal being pumped by out of passband signals. That's bad. It may be that we just need to ignore AGC until we have enough digital dynamic range to let us use your feed forward idea. That will certainly give gain leveling on the DSP's *output*, if its input can stand the guff without saturating. I *know* that 16 bits isn't enough. 24 bits may be enough, and 32 bits certainly would be enough.

Well, the front panel probably adds less than $100 to a radio, so the
savings of off loading it onto the PC isn't as great as you might think.
It is certainly easier to see and easier to use. And it allows one to easily
automate operation via external programs. You've got to have the computer
anyway to operate digital, or to log if you're a contester. And how else can
you get a realtime Smith Chart display of your antenna? Their mobile
mount kit lets you operate with only a laptop up front in the passenger
compartment. I like that. And you can operate remotely by modem. I
like that too.

> One thing I definitely did NOT like was changing frequency using

>and flexibility for competent CW ops).

Well, you don't have to use the arrow keys. You can use the mouse,
or you can use direct keypad entry. I found it easier than a knob, and
more precise when tuning in a Clover signal. You can use a keyer with
the radio, or even a straight key. You aren't chained to the keyboard
for CW if you don't want to be. But it is there if you want it. A nice touch
I thought. A nicer touch would be to add a good Morse/RTTY decoding
capability. It's probably too much to ask of the busy DSP to do Clover
or PACTOR II, they'll have to remain in their separate DSPs for another
hardware generation or so.

BTW, what did you think of the AGC action? Did you notice overshoot
and undershoot problems? Or pumping by out of passband signals?
I didn't, and I don't know why. I can't get *my* DSP to do good AGC.

I've been trying to do DSP on the PC too. Fighting with the SB has eaten
up most of my development time. It sure is easier to do with a dedicated
DSP system.

If all else fails, you could probably order it as a replacement part for an existing rig. IIRC the Icom R-7000 receiver has a 10.7 -> 455 conversion; maybe the Icom parts people could identify the crystal in question and sell you one.

EF Johnson stocks them here in the US. That is the crystal they use for
the second conversion from 10.7 to 455 in their LTR trunking equipment.

>we just need to ignore AGC until we have enough digital dynamic range
>to let us use your feed forward idea.

If you want to keep the A-D within it's dynamic range, then you MUST
allow out of (DSP) passband signals to control the AGC...otherwise
they would overload the A-D like a desired signal does....worse
actually, as you now have QRM modulating the desired signal.

Another way of saying that: In order to keep the ADC within range,
The whole signal going into the A-D has to be used for AGC.

Yes I do understand your point....The QRM is also modulating the
desired signal via AGC if it is allowed to contribute within AGC loop.

One idea would be to have the DSP read the AGC control voltage via a
slow/coarse A-D, It could then scale it's output according to the
known agc factor that had been applied prior to the DSP, Then it could
do some digital leveling to account for the case when it is the
desired signal, and not QRM which dominated the AGC action in the
first place. In this case, an interfering signal degrades the
effective resolution of the DSP, but does not change output level.

Hello all,
I am looking for a mod to REDUCE the Power out of the HTX-100
10M mobile radio down to say 100Mw?

I am aware of the common three mods:
Increase power to 35W
Expand coverage from 26.0 - 30.0 MHZ
Increase mic sensitivity

I am looking to use the HTX 100 as an IF rig for a DEM 220MHz transverter however,
I need to get the RF drive down to less than a watt.

ANY ideas out there??

Hi Gary OM,

Thanks for your remarks on the Kachina. The positive points you make
are well founded as usual in your posts Gary.

I liked the AGC action very much. However, I am one of those old CW
guys that like to run manual AGC anyway (ride the RF gain). That is why
I too get along just fine using a phasing DC receiver (no AGC).

No computer is required, of course, to use the "digital" modes (such as
TOR) with an external data controller ('232, KAM, etc). I've been
fiddling with TOR for over 14 years now, using a dumb terminal and RS232
interface to the controller. (Yeah, I know, using a computer and shell
program is nifty and convenient, but I actually enjoy doing things the
hard (and different, and inexpensive) way, one of the enjoyable aspects
of homebrewing. It gives me (the operator) something to DO!

Have you heard of the external Knob that Kachina is going to offer, for
$200 additional? Now there is a cost-effective solution, egad!
Kind of reminds me of Hal not having any tuning indicator in the
PCI-xxxx PC plug-in card for TOR. Later they offered an external one at
a very high price. Kachina is working on the product and it will get
better; just not there yet, in my opinion.

Alex - I'd suggest you get some good books (try hamfests or ARRL) and have a look at a few homepages on the web.

A good book is Solid State Design for the Radio Amateur, though you may wish to start off with something simpler.

As for sources on the Internet, SM0VPO's Home Page is one of the best - there are many projects on-line. You may also want to check out my own home page. There are a lot of articles for the newcomer to amateur radio, and there is a bias towards homebrewing, including several constructional articles and circuits. I hope to add more of these soon.

I was a bit older than you when I built my first real transmitter in 1987 (1 valve crystal controlled on 80m). However these days homebrewing has never been easier or cheaper. I'd suggest you experiment with direct conversion receivers, especially simple designs that use a NE602. As for transmitters, CW ones are the simplest. However double sideband on HF is quite simple and 100% compatible with SSB. Ceramic resonators are good for frequency control on 80m. More info on my home page (URL below).

I've had considerable higher amount of interesting QSO's, several QSO's
with LA7MI or LA6VM on 80/40m ssb lasted over 5 hours, I might even had
many interesting 2m FM QSO's, even some on repeaters!!!

>Conversation is a two-way street. If you have nothing to offer, chances are
>you will get nothing in return. It's that simple.

it is perhaps not too difficult to find somebody to make an interesting
conversation with, the problem is all the breakers (read: Intruders),
interrupting an interesting conversation without having anything to add
to the discussion. I usually overhear intruders, but unfortunately the
opposite stns does not.

Still remember a G-stn I worked on 144320 some 20 years ago, we had so
much to talk about, but so many angry stns waiting to work to LA

Jason...I don't know the HTX-100 but if I was wanting to try what you want...I think I'd try to pull the final transistor(s) right out and bypass 'em....yer driver becomes your final....Another common way is to reduce your supply to the final transistor...try cutting it in half for starters and measure the output (JUST THE FINAL AMP though!).

That's about what I would have suggested. The 10.240 MHz crystal is
also used in the CB sets to convert from teh 10.7MHz first IF to the
455KHz second IF. As long as the first filter is wide enough, the
10.240MHz crystal works okay.

Lots of other pieces of equipment have a similar conversion scheme.
You might find them at garage sales (or maybe a repair store happens
to have some of these that have been discarded). I'm not sure they
should be seen first as a source of the crystal, rather than considering
converting the whole unit, but I guess it cepends on what you find
and how many.

The superhet (ie more expensive) 49MHz walkie talkies use these crystals.

Baby monitors might; I haven't seen their insides so I don't know
if they are superhet or superregen.

Cordless phones (that operate in the 49MHz range at least) would probably
have them.

Someone once wrote about finding such a conversion scheme in a cellular
phone. It might depend on the unit. The one I picked up at a church
rummage sale for fifty cents had a much higher first IF.

A lot of older scanners and monitor receivers used this conversion scheme.

Also, a lot of older ham FM equipment. Some commercial 2-way FM receivers
used them, though there seemed less of a standardization.

The 10.240 MHz crystals might also be more readily available in those
lists of "computer crystals" that you see in catalogs. Divided by
1024, easy to do in binary, gives you 10KHz, which is obviously more
standard than 10.240MHz looks like.

Since Never. And the TE-1 hasn't been for years, either. That's not the point.

Possesion of this equipment isn't illegal, nor is its sale. You can do illegal things with it. You can do legal things with it. You can use it responsibally, or irresponsibally. Like your car.

Responsible use of this would include backup or emergency use for a severely budget-restricted liscensed FM station, or a community station. Responsible use would also be, IMO, quality, interference-free pirate broadcasting. This transmitter is capable of such, with an RF output cleaner (yes, I've measured it) than the majority of low-power type-accepted equipment that I've seen. Like all transmitting equipment, it requires a decent amount of RF experience and general give-a-damn to use properly. The same goes for your big ol' sweep-tube linears.

Get over the whole "illegal = irresponsible = immoral" crap. This is good stuff at a bargain price.

Lot of 10 NEW 14 volt grain of wheat light bulbs. Most rigs use 12
volters. These are 14 volters and put out just about the same amount
of light on 12 volts as the 12 volters do. They should last virtually
forever once replaced in your rig. This voltage is quite hard to find.
Mostly one ends up using 12 volters only to have to replace them again
in a short time. These bulbs draw apprx. 60ma. at 12 volts. I found
these at Dayton one year and bought up all the guy had. Lot of 12
grain of wheat bulbs $10 postage paid to you.
Email me if interested. Also have some of these up on eBay if you want
to play the auction bidding game.

This is a bad problem only if the input signal is swamped by the
internal noise generated by the agc stage or other stage between the
agc stage and the ADC.

Even if the desired signal (after agc) is less than the LSB, the
signal can still be isolated, _provided_ there are some other strong
(out of the desired passband) signal at the ADC input. The other
signal will constantly shift the ADC decision levels (when viewed from
the desired signal point of view).

Look at ordinary CD recording, the ADC is 16 bit and thus the expected
dynamic range is (about) 96 dB in the 0.. 20 kHz bandwidth. However,
since today dithering noise is added to any professional recording,
low and middle frequency tones can be extracted well below -105 dB
from the full scale. (An audio spectrum analyzer and a "fade to noise"
test CD is a good tool to measure the linearity of the DAC in a
CD-player).

While in a receiver, the passband signal entering the ADC does not
have optimal statistical properties to act as dithering noise, the
unwanted signal still (conceptually) alters the ADC decision levels,
thus, even if the desired signal is suppressed by the agc down to 1
LSB, it is not completely lost.

> terminated in.
>

Strictly speaking, no. If you don't know what the filter is
supposed to do, then it is impossible to tell if it starts doing it when
you measure it in different impedence environments.

In practice, there aren't that many different main applications,
so a quick try with 50, 500, 1000 ohm environments will give some clue
to its purpose. After this, you muck around with the impedence until you
get the best performance for your guessed purpose. 50R filters are
usually purely resistive terminated, other Z's may have a capacitive
component added like 1000R parallalled with x pF.

Look for equality of ripple amplitudes in the passband, look for
equal peaks between the passband's return loss nulls as clues for fine
tuning the test impedences. Passband artefacts are significantly
sensitive to Zo errors, and many filters are designed for chebyshev type
passbands with equal amplitude ripples, so these are likely to be your
best guide.

Source record: 83739

I've got a question. The obvious problem with receivers using DSP is that you need to limit the dynamic range of the signals going in to the DSP to stay within its A/D converter range. And to do this, you have to control the un-DSP-filtered signals before they reach the DSP. This could be realistically accomplished by putting an AGC system ahead of the DSP, and there wouldn't be the problem of the DSP being in the loop.

On the other hand, you don't want the AGC to be dumping the gain when a loud out-of-band (i.e., outside the DSP filter bandwidth) signal comes on. So this requires AGC following the DSP (or including it) rather than ahead of it.

Even without the problem of DSP delay in a loop (such as in a superhet where the DSP is operating at a reasonable IF), how can you resolve these two apparently contradictory criteria? That is, how can you AGC-control the signal going into the DSP without its reacting to out-of-band signals?

I've worked with A/D converters only a little, and with DSP not at all. But I do know you have to limit the time-domain input to the DSP to avoid overranging. Wouldn't an excessive signal cause distortion and other problems even if its frequency-domain components are outside the band the DSP is filtering? If so, then even if you could put the DSP in an AGC loop and make it work, it wouldn't do the job of limiting the DSP's input signal so that the input signal stayed within the DSP's dynamic range. For example, suppose you had an IF of 1 MHz and a DSP filter bandwidth of 1 kHz. You use the output from the DSP to AGC control an amplifier ahead of the DSP. Then a huge signal comes on at 1.01 MHz. It wouldn't get through the DSP (except as a distorted version due to overranging, and distortion of desired signals within the 1 kHz passband), so wouldn't reduce the amplifier gain to bring the DSP input signal level within bounds.

On the surface, it looks like the only solution is to have enough dynamic range in the DSP to handle the full range of input signals, then apply AGC following the DSP. Or am I missing something here?

Hm, or maybe put an AGC ahead of the DSP. Then put a gain-controlled amplifer after the DSP, and make its gain increase in proportion to the gain reduction ahead of the DSP, so the overall gain stays the same but the DSP stays within its dynamic range? Maybe this could be done in a few steps of, say, 10 dB each rather than a continuous range, so it would be easier to implement. And follow that whole mess by another AGC system operating on the DSP-filtered signal. Might sound strange depending on where the noise is generated in the system, but might work.

Source record: 83740

I am looking at my Alinco DX70 with a view to reducing the power consumption at the 10 watt level. At present 10 watts of CW takes 7 amps at 13.8 volts, a bit much using 96 watts of DC for 10 watts of RF!. I suspect the PA is being biased for 100 watts of SSB on transmit but I have not checked this out yet. The reason for my wanting to use less power is to reduce the weight of the Power Supply needed when I go on holiday. If anyone as already looked at this it will sve me some time otherwise I will publish my results here if I am successful. Otherwise I think the rig is a beauty.

Thank you, Paul. That explains why 16-bit DSP filtering works on the weakest moonbounce signals, responding linearly down into the noise with no audible sign of quantization thresholds or any other 'digital' effects.

The FCC is currently considering licensing low power FM stations
for use on 'unused' local frequencies in the FM band. Only those
causing interference to other licensed operations would be
considered pirates. Presumably there would be no type acceptance
of equipment, since there would be no way of inspecting sites.

It has been a while for me also...but luckily I kept the old ARRL book that has it...p273 of the small black and red issue of the VHF Manual shows: blue and orange/black to ground....red/green has +9v fed to it thru 470 ohm resistor....then a blocking cap (1-2.2uf) in series from that contact to a 1K pot and thats the output!! Make sure you observe polarity of the cap (+ to the battery; - to the pot)...and maybe use another cap on the wiper of the pot as well (.1 or larger)...

PM needs multiplication to get decent enough deviation at the output freq.....normally PM gets only 0.5 Khz of dev on the xtal freq... PM can be easily added in most stages of the xmitter (immediately after the xtal stage that is; not in a multiplier stage or amp)

Also, please note 5 Khz FM is only legal ABOVE 29.000Mhz...and Tech+s on 10 cannot run anything but SSB and CW (incase someone was wondering)

It is *very* unlikely that the FCC will return to licensing low power stations. They stopped because of all the mutual interference problems and lack of rule compliance due to low power broadcasters. But if they were to resume licensing low power stations, they would almost certainly require use of Type Accepted equipment as they did previously. (Even an unlicensed service like CB is required to use TA equipment.)

And if a station is licensed, the FCC would then know where it is located (that would be on the license), so they could pull inspections. The FCC hasn't been very active in performing their legally mandated compliance duties of late (they've laid off most of the field staff and hired a bunch of DC lawyers to run spectrum auctions), but that could change very quickly.

A new Administration, or a Congress read the riot act by the NAB, could get the FCC back to doing their legally mandated job in a hurry. Then the RIs would again be out looking at stations and making sure that their equipment is TA, that towers are properly marked, that proper logs are being kept, etc. I think most of us in broadcasting would welcome that.

And many amateur radio operators would similarly welcome a return to proper regulation of the amateur service. A few thousand pink QSLs with stiff fines attached would go far toward cleaning up the mess that HF amateur radio has become.

One of the problems that compliance activities have faced is the inability to collect fines. The way deliquent student loans are now being handled could serve as a model to change that. They're turned over to the IRS, and a levy is placed against the offender's income through the payroll withholding system. The FCC could do the same for fine collection. (Some hard jail time for the worst offenders would have a salutory effect too.)

This approach is used at Rockwell-Collins. It is difficult but feasible.

DSP Blaster doesn't do quadrature demodulation.
It can filter the demodulated audio like any other
audio DSP, but it can't give you single signal, IE
you don't get the opposite sideband suppression
that quadrature demodulation in DSP gives.

If K6STI were to add that ability to his program,
he'd really have a winner for those of us trying
to do a minimum parts count single signal
receiver.

I've been trying to move the DSP for my R2-like
receiver from a hardware board into the PC for
several months now in order to reduce the receiver
parts count, but I'm obviously not up to the task.

Working with sound cards (especially knock off clones)
appears to have some "black magic" features that I don't
fully understand. I think that's mainly just a lack of good
documentation and example code. With the evaluation kits,
there is plenty of documentation and plenty of example code.
I haven't found the same thing for sound cards. (It may be out
there, but I haven't found it.)

Beezley obviously understands how to work with the Sound
Blaster card. So he could do it. I'd really rather have some
working commented source so I could splice in my own
processing routines, however. Black box programs aren't
that much fun for me. But others might be quite happy
with something that is load and go.

>screen...any ideas?

Dave, you'll probably find that a capacitor in the vertical output amp
has cooked out. This is a common cause of this behavior. Try to
get a schematic of the set. Check the vertical circuit for electrolytics
that might have become leaky. Sometimes you can just look and
see a cap that's discolored or spewed, other times you have to
dig in a bit more (ideally with a scope) to find the bad part.

Another possibility is that you have a partial short in the yoke.
If that's the case, junk the set. New sets of this type are so cheap,
it isn't worth the aggrevation to try to replace a CRT or a yoke
assembly. They're computer matched at the factory today, and
you'll never get an unmatched yoke and CRT to converge
correctly. (They don't include enough manual adjustments in
these sets to do it by hand.)

> and two meters never ceased to amaze me.

Did it ever occur to you that it takes two to make a conversation? It's not new to bow out whenever the content of the exchange gets so light as to be uninteresting, but I've frequently been surprised what a seemingly unrelated comment by me brought out of the other party and what interesting "threads" it sometimes led to. Frequently other hams join in who were just monitoring when the interesting stuff started, and who now find reason to join in.the proceedings. This frequently leads to extensive roundtables that go on for some time, interesting all the way, on most any subject you could think of. Don't blame ham radio for your own shortcomings as a conversationalist.

One of the most interesting on-the-air groups I get into is headed up by a fellow who is a wheelchair quadriplegic, has very limited usage of his upper extrremities and still builds amplifiers and tuners. He is also an accomplished machinist and gunsmith, and is knowledgable in a wide variety of subjects. Throw a comment out for this crew and it draws anything but dull responses....There are a lot more people like that on tha air than you evidently could imagine.

I am designing a 2M and 440 Yagi for cross-band use, and have run up against the problem of feeding the thing. As this is experimental, and as I am a beginning antenna designer/constructor, I want to keep the scheme as simple as possible. I would like to feed the antenna so that band switching is done automatically, and ideally passively. I want to avoid the use of manual switching. I will be transmitting mainly on 2, and receiving on 440, though occasionally using the yagi single band. All input gratefully accepted.

The one I've taken apart goes right from 49.[something] down to 455 kHz
using a MC3361. Pretty deaf, but what do you expect for 1/2 of $25.

But, otherwise anything using a MC3361 or equivalent (Philips NE604?)
narrow-band FM IF chip will probably have one of these crystals.

>The 10.240 MHz crystals might also be more readily available in those

The stock microprocessor crystal frequency selection is pretty strange.
A lot of these values are for ancient chips like the old SMC (and Harris?)
baud rate generators that nobody has used for years.

Yeah. You can purchase the programming software, the Radio Interface Box (RIB) and the specialized interface for that model of radio from Motorola and do it yourself. The materials will set you back somewhere between $800 and $1000, or you can send it to me and I will program it for $30 plus tax and shipping. Your local Motorola service shop should have similar rates.

One way of looking at the situation is that the dithering noise (in
this case the sky/receiver noise) will convert the low frequency
wanted signal to some form of pulse width modulation (a pulse train of
at least 1 LSB pulses) . When in digital domain with high precision
arithmetic, this pulse width signal train is low pass filtered
(averaged) and the low frequency signal can be recovered with great
fidelity. Since the width of each pulse in the pulse train is
quantified (a multiple of the sampling period), it is important that
the sample frequency is much larger than the frequency of the signal
of interest.

I haven't followed the discussion about digital audio recently, but
this is closely related to over sampling and noise shaping and a
modern text book about this might give some new ideas.

While dithering works well for baseband signals (0.. Fs/2) I have no
idea, what artifacts might occur from directly decimating (a
bandlimited) IF signal with a sample frequency well below the IF
center frequency (in which case the IF bandwidth must be limited to
Fif-Fs/2 .. Fif+Fs/2).

Hi
having spent some time developing a wide band digital receiver, we found that we needed a double loop AGC. The first loop senses the amplitude at the first IF (twice the final bw) and then dampens the signal to a reasonable level.

Next loop does acctuallly include the ADC. First put out a high attenuation value, and sense the measured amplitude, calculate the correct value for the attenuator and use this for a certain amount of time.

This works for us with our wide-band receiver (bw 10 MHz).

I am sure there are better ways of doing this when dealing with narrow-band receiver.

Whatever you can do with a analog signal, you can do in the digital
world too,
Except the relative amplitude of the signal is smallet than one step in
the ADC .

One word of caution, a lot of telecom power supplies float battery banks and aren't designed to handle heavily modulated (varying at syllabic rates)loads. Others are designed to run banks of equipment without batteries, and experience a fairly steady load without appreciable speech modulation because their big load is really made of an awful lot of small ones, and their modulations don't correlate.

Powering a big class A/B power amp handling a single SSB or OOK Morse signal is a particularly interesting challenge for a switch-mode power supply design. A lot of available supplies could misbehave, and MRF154s are awfully expensive....

This is why I prefer an up conversion stage with a roofing filter before
any other signal processing, analog or digital. It limits the probability
of there being a very large signal within the passband that feeds the
demodulation stages. Even so you want to have the AGC developed
from the voltage present in that wideband first IF if the second IF is
going to include active (analog or digital) filtering or stages that may
pverload on signals outside the detected passband. Once you have
the signal isolated you can proceed to normalize it any number of
ways, which is a form of AGC. But you kinda have to watch the
various loop interactions to avoid strange sounding effects.

> Even if the desired signal (after agc) is less than the LSB, the

> (out of the desired passband) signal at the ADC input. The other
> signal will constantly shift the ADC decision levels (when viewed from
> the desired signal point of view).

We;; known effect. In fact some of the Magnavox spread spectrum
radios (most actually) REQUIRE the addition of some noise or they
will not work correctly as they exploit this factor. It is sorta strange
to see someone hooking up a signal generator tuned a little off the
center frequency to use as a "beneficial jammer" for such receivers.

Why is this drivel posted to the "boatanchors" discussion group?
What does it have to do with discussing classic tube-type gear?
Shouldn't this kind of thing be posted to the "policies" group?

Hello,

I'm interested in using an old Motorola speaker from my junk-box, and am having trouble finding the description of the amplifier wiring. The speaker is stamped TLN1877A1 on the back, and the internal board is labelled TRN6775A1. The part that is strange is the number of wires used to hook the thing up. It has 7 coming out of the box, which is more than I thought were necessary (2 for power, 2 for audio, what are the last 3 for?)

If anyone has any information on these speakers, or tips on how to figure out the wiring, I would appreciate it. Thanks!

But you can't do it with DSP Blaster. It is commercial software and
only does what it does, which doesn't include quadrature demodulation.

I think that this is the same frequency of xtal used for the synthesizer
circuit in older cordless phones. Also used in Radio shack multi frequency
49 MHz FM talkies (any place that uses the Motorolla chipset if I am
remembering right). If you are homebrewing a one of a kind
design, you might try that. People know that I collect junk like this,
and usually leave them on my chair at work without telling me ;^)
I also remember seeing them in digikey.

Hi Len,
I use a free program by W5LA. It is available for download at
http://cust2.iamerica.net/jragsdal/ham.htm

The only necessary hardware is a simple interface (described in the
documentation of the program) and a DOS computer. The interface will
cost less than $10 to build, and can be assembled in just a few
minutes with parts available from Radio Shack.

If you have further questions, send them by email to W5LA@iamerica.net

Jim will be happy to help you.

Well now, those controllers have a computer embedded in them. For anything
beyond RTTY, you need a computer to do the protocol. Might as well just let
the computer handle it all and dispense with the TNC (obsolete paradigm IMHO).
Beezley's RiTTY is better than either the PK232 or the KAM.

>Have you heard of the external Knob that Kachina is going to offer, for

>better; just not there yet, in my opinion.

Yeah, I saw the picture of the knob. It is an obvious concession to those
who aren't comfortable with computer control. I don't see a need for it.
I found the on-screen tuning method satisfactory. But offering it as an
option to those who aren't comfortable with computer control is Ok.

There are a few rough edges to this radio, and to its control software, but
since they give you the full API, you can write your own programs to run it.
That's exciting to me since I dearly hate being wedded to Windoze. If I
buy one, I'm writing a Linux program to run it.

4228. High-performance receiver design

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-21 00:00:00 UTC
From: stoskopf@tri.NET
Message-ID: <353D0395.F3611741@tri.net>
Source record: 83694

My early thought on AGC was to somehow pick off the output of the AD converter directly (outside the DSP circuitry) so that when it reached some (not) arbitrary high value, it would send a pulse to add a small amount of DC to the analog AGC in the IF or RF preceeding it. A sudden strong signal would hit it many times rapidly (at the 15 KHz rate?) quickly bringing the system to the AD's range. It could decay at some RC rate or intelligently from the digital stuff. This is roughly the way that the Plessy SL64xx series audio dervied AGC chip works and I found it to be the best (as good as AF AGC is) for an early RX here. The drawback here (as with the Plessey chip) is that without an S-meter, everyone is S9 and you judge the signal strength by the background noise (which should be gone with even minimal DSP processing).

4229. Crystal Filter Question- Answered

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-21 00:00:00 UTC
From: owens@ale.atd.ucar.edu
Message-ID: <6hj0tombp1@ncar.ucar.edu>
Source record: 83695

Thanks to all who responded to the question on finding the
proper termination value for unknown crystal filters.

Brief summary: To find the termination impedance for a crystal
filter: sweep the filter with a spectrum analyzer/tracking
generator or equivalent. Connect generator to filter via a pot.
and also connect a pot to the output side-before the analyzer.
While sweeping the filter look at the ripples in the passband
response & adjust the two pots for minimum ripple in the passband.
When it is as good as you can get it-stop, measure the resistnace
value of the pot on each end-this is the value to use to terminate
the filter.

Suggested "standard" values for terminations include: 50, 200, 500,
and 1000 ohms.

Once you know the value for the termination you can use a transformer,
auto-transformer, or L network to provide the proper terminating
impedance to the filter.

Many thanks to Dave GM4ZNX, Harold W4ZCB, Chuck KD9JQ, and others
who responded.

Does anyone know where I can get a schematic for a HP Deskjet 500. I tinker in electronics and can build, but I need the power requirements for the socket on the bottom of the printer.

If someone has the diagram they scan and send me as an attached file.

I had a business trip to San Francisco last week, and dropped
by at HRO Sunnyvale. Last time I was there (a few years ago now),
there was a great surplus shop across the road called Wierdstuff.
Does anyone know if they are still in business, and if so where
they have moved to?

I expect to go back to the Bay area in the next few weeks, are there
any other surplus shops that should be on my must visit list?

Regards

Stewart G3YSX

I've been told that Weird Stuff has moved, and only conducts pallet sales and such these days. No great loss IMHO; their stock had really gone to seed over the last couple of years.

Other places I usually visit when in the Land of Woz include Alltronics on Zanker Road in San Jose (great surplus place, lots of RF parts); and Halted Specialties, just off the Lawrence a few blocks up from where Weird Stuff used to be.

Halted is a more-than-adequate substitute for Weird Stuff.

I'd say you were unlucky, I've been licensed since 1965, built many pieces of
equipment, synthesized multiband transceivers, test equipment like a spectrum
analyser module and the like. I never owned a commercial rig until 1992 when I
saw them at a price Stateside that was hard to pass up on.
Over the years I've had skeds with many parts of the world, seen a few of those
I worked when on my travels. I even had a good long chat with the skipper of a
Varig 737 flying between the Capital of Amazonas State and Recife. It depends on
what interests you have, I enjoy chats on general things, airplanes (sexiest
things on 3 legs), radio and lots more, I shun the computer chats except with
people I know, the ones who will go on about how wonderful Windoze XX is and
it's outstanding packet software, poor blokes salivating over Microdro$$
operating systems.
Anyway, got a CT-2 to fix and get packet back on the air and if it stops
raining, get drilling a wall to pur that 2m antenna up above the roof.
One day soon I hope we can make the jump to 56K packet and shift some real
stuff, we keep moving an inch at a time modifying ex-PMR stuff, but think we
need to build from scratch.
Regards

The ten-tec can be changed by changing 1 resistor value to handle 10
watts with no problem. The manual that comes with it shows you how to
do this and what value resistor to use on input pad. No problem, plus
they really work great, I have the model 1208 here and have modified a
1209 to do the 10 watt thing.

Yah.
1) Tilt switch, a'la pinball machine.
2) Cam, with a row of switches and/or pots around it.
For 2 dimesnions, use 2 cams. Integrate.
3) Mercury sphere attitude ball.
4) For cheapies, use merc switches out of old T'stats.
the resolution will increase with the number of switches.

Hope this helps.

I've looked for 'em and not found much. In fact, much practical info on broadband receive antennas in general is found in TV books from the late 40's/early 50's. Most design features present today were discussed then, but we have better materials making some designs practical today that were not practical then. I've wondered about UHF rhombics as a simple homebuilt antenna, much easier to amke with plexiglass being common now..
What I can find about gain figures on modern large commercial TV antennas is amazing. 120"-150" long antennas seem to post in this neighborhood as far as gain (when you can find anything at all. The brand names don't publish much at all about gain):

Low Band TV. 2-3db gain
FM .5-2 db gain
High Band TV 3-6 db
UHF 15-30 7-9db
UHF30-50 6-8 db
UHF 50-70 5-7db

That is pretty pitiful compared to even broadband separate yagi's. Stacked conicals in 1954 gave 6db on lowband VHF & FM & 7-9 Db on High VHF. Even a 4-bay bowtie gives 10db average across UHF. A long dedicated UHF yagi can hit 14db over it's best 20 channels. It seems the "all channel" compramise is worse than some would have us believe. I'd say an separate FM antenna is a must (at least!).
At any rate, it's not an easy subject to research, in my experience.

I recently saw a presentation by a vendor selling low-loss coax. He had a piece of what looked to me like about 12 feet of RG-58. He said that by putting a ferrite bead on the center conductor at each end inside the N connector, he makes an assembly with negligible loss at 1.2 Ghz, around 1 db at 2.4 Ghz. Could he have been telling the truth? Makes no sense to me.

>sense to me.

Me, either. Coax loss up to a few GHz is primarily due to the resistance of
the center conductor, and increases with frequency because the skin depth
gets shallower as frequency is raised. There's no known cure for this.
Adding ferrite to the center conductor will increase, not decrease, loss.
And the increase could be quite large, depending on the type of ferrite
used.

It's snake oil.

Hmmm...I'll be looking for some soon...here is what I found:

Surplus Sales lists some, $4 ea:

http://www.surplussales.com/CrystalsList.html

Or, try Radio Shack Repair parts (*NOT* the store). This part
number is all over their site:

Cat.No. Description NP Part #

10590701 CRYSTAL,10.245 MHZ CX0344

To order RS parts call 1-800-843-7422

You could also try the Crystal Manufacturers. They might have
stock of these "common" crystals.

Try JAN or ICM

JAN Crystals
1-800-JAN-XTAL (526-9825)

I have used JAN before. A few years ago, I needed a replacement
crystal for a cordless phone. For about $15(?), they cut one to
my specs and shipped it within a week.

International Crystal Mfg.
1-800-426-9825

I have never dealt with them.

Good Luck! Let us know what you find out!

Cheers,

A tilt switch will do it, mercury in a bulb with contact wires. Probably scrounge one out of an old thermostat. If you're not allowed to play with mercury, a ball bearing in a tube with contacts imbedded in the tube will do it too.

Alltronics & Halted both warrant visiting, but my favorites are Haltek (in
Mountain View), R. A. Enterprises on Delacruz in San Jose (look for the
double-decker bus parked in their parking lot), and Excess Solutions
on Brokaw in San Jose.

R. A. has a good selection of old test gear & computer equipment - prices
and quantitites vary - sometimes you can find great deals, other items
are, in my opinion, way overpriced. Lot's of strange stuff - a fun place
to just wander around, but not the place to go if just looking for parts.

On the other hand, Haltek is great for parts, and also has a selection of
test gear that's worth checking out (although the good pieces usually
go quickly).

Excess Solutions is pretty much parts only (they have/had a bin of "free resistors" - don't know if its still there). I've found a number of interesting parts there - usually my first stop for things like connectors, dial lamps, knobs, and other miscellaneous hardware type stuff. Not where I'd go, though, for IC's, resistors, or caps, but unusual and interesting items can be found.

Alltronics, Excess Solutions, and R. A. Enterprises are all close to each other - if you visit one, be sure to check out the others.

And of course, don't forget the Livermore & Foothill swapmeets!

When I was a kid I bought a piece of " everlasting toffee ", I was very
dissapointed five mins later. This coax sounds like the same product,
was it for sale on april 1st?.

Maybe.
I am reminded of the stuff said about the first triode that was
offered for sale by Lee DeForest. They even got an injunction
against him because it went against all the (then known) laws
of science.

I would suggest you try something like it and see what it does.

THEN form theories.

Hi Guys,
I'm interested in the RF electronics 500w skywalker amp. It comes in a kit or they will build it for around 175.00 extra. it covers 10m-160m , can this be modified to cover 6m? and how difficult is it to build? (limited experience). and looking to build a 2m rig..Who sells a good 2m kit?

Yes, I understand dithering. But if the other signal is coherent, you'll wind up with the modulation of *both* signals on the output, even though one of them is undesired, and outside your DSP filter passband. That's still rotten.

A lot of these amps use transistors which aren't qualified for AB1 operation.
Even if you bias them properly, linearity is still poor. And even if they use the
right kind of transistors, you'll probably have to redo the input and output
networks because biasing them for linear operation will change the optimum
input/output impedances.

If you want to try it anyway, you can wire up a 3-terminal regulator as a
current source and use it to bias the transistors for AB1 operation.

The people trying to debunk DeForest didn't have science on their side,
though. There wasn't much theory to speak of. OTOH, transmission-line

theory has been around for a few years now, and could almost be considered to be -- gasp! -- a solved problem.

Extraordinary claims require extraordinary proof. And the burden of said proof rests entirely on the sellers and evangelists of such an extraordinary claim as "lossless coax." Do you have some insight that suggests that ferrite beads reduce coax loss?

If you are just looking for one crystal you should have no problem getting one from your local two way radio shop. Almost all the old Japanese vhf radios that were crystal type would have this crystal in them and all the shops in our area are throwing them away. You could get one and pirate the offset crystal from it..

Coaxial cable and ferrite beads aren't black magic or even particularly
new.

I wouldn't be surprised if the 'inventor' is purporting low loss
based on low SWR. Everyone should know (but doesn't) that *more*
loss (like adding ferrite beads) results in lower SWR.

Web sites? No. Maybe somebody who makes RF power transistors?

You'll need to rebias the active devices, recompute all sorts of
impedances, accept sub-optimal performance from transistors
that were never specced for this kind of operation anyway, and
substantially derate the transistors.

You might have a look at Dye and Granberg's book on RF power
transistors. The relevant chapters in the VHF/UHF DX Book
(edited by G3SEK) are worth a read too.

Absolutely not! And he is talking garbage!

And how can he tell you what the loss is when he does not specify length
other than showing you a 12ft length. If he is showing a 1db loss over
3m then that transposes to a 10db loss over 30m (ie 100ft) - diabolical!

Get somethings straight in your head first...

1. There are losses in all cables - even wave guide and air!

2. Cables are specified as loss per unit length - be that per metre or
per 100ft or what have you.

3. The ferrite would have little effect at 1.2 but the cable TYPE would.

Most low loss cables at VHF/UHF are either double screened large
diameter types - or have corrugated continous copper screens with large
diameter centres.

Low loss microwave coax uses some pretty serious technology in the way
of cable and at cost. Coax for these freqs can easily reach $10 per
metre for a start.

Ignore what he says and go on common sense - you won't go wrong!

My web site has information on biasing for class AB.

Unfortunately, even if they're correctly biased there is still no
guarantee that the devices will give low-enough distortion to be usable
on the air.

Wow Sid,
To me, most of their prices seem astronomical. ex: $35 for a 5-plate
small air variable, $175 for a 4-section 450PF/section ("Broadcast")
variable... etc. These items are a few dollars at a ham swapmeet, or
via ads in Electric Radio, or...
I recently purchased a 50KV/ 15-500 PF vac variable (Jennings
ceramic, 220 amps) for $200 from a private party (yes, it tests good,
and no, I don't normally buy such expensive components). I noticed a
similar item is priced at $2395.00 in the above Surplus Sales catalog at
their web site.

Hi Gary,

You are essentially correct, but let me nit-pick a bit: The controllers (PK232 and KAM, etc) have microprocessors in them of course. Their internal (EPROM based) firmware does all of the protocol encoding and decoding for the modes supported by these boxes (CW, RTTY/baudot, Amtor Pactor). The host computer (or dumb terminal in my case) does none of the protocol work; it is just an RS232 input/display device.
Now, the multitude of software packages available for these boxes (from the manufacturers as well as third party software) access the controller via a host mode, which is a more direct link to the firmware in the controller, but the firmware still does the protocol encoding/decoding.
Another small observation or semantic nit-pick, if I may: The term "TNC" (Terminal Node Controller) has no meaning for anything but AX.25 packet protocol, manufacturers' advertising notwithstanding. There are no "terminal nodes" in RTTY, AMTOR, PACTOR, etc. I agree: the term TNC for HF data controllers should pass into oblivion (along with HF AX.25 packet itself).
I have not used Brian Beezley's RITTY program, but I have talked with him about it, and it may well be an excellent performer, and a harbinger of how things will be done more in the future. I personally would prefer a dedicated solution not involving a Soundblaster or other PC "sound" card (or any PC for that matter), but (as usual) that may not be what is most marketable as a commercial product (so, again as usual, I will probably have to homebrew it!).

This is a good thread going here.

Could it be that he was talking about *return loss* rather than transmission loss? The quoted performance numbers don't particularly make it sound like it but that's about the only way I can think of it as other than snake oil.

A sufficient length of rg58 combined with some ferrites might in fact make a decent dummy load; close to 50 ohms resistive with little reflection. The beads might help performance at very high frequencies if the cable were of poor quality. Though usually poor quality cable (lossy) does that all by itself.

At 400 MHz and above, I've used a suitable length of coax and a lower power termination to synthesize a high power dummy load for an EME transmitter. It's necessary to pick the cable type and length to spread the dissipation out over its length and not overdrive the final low power termination, but it can work pretty well.

Who knows, maybe it's a snake oil cooled dummy load he's building...

No it didn't, not at all. They merely conned the courts with bad science
- a practice that continues today.

>I would suggest you try something like it and see what it does.
>
>THEN form theories.

The theories for this one already exist and they're dead right! Anybody
who knows what a ferrite bead does can tell that it won't work.

... unless you're deeply into wishful thinking. In that case, you're
sure to be interested in Gainiax (tm). Eliminate those difficult
negative decibels and invest in coax that adds positive gain!
No big, noisy power amplifiers - just our high-gain coax. The more you
buy, the more gain you get.

WARNING: never connect this product into a loop, because it will burn
out your connectors after a few seconds... unless of course you use our
special connectors with ferrite beads, which will stay completely cold.

Gainiax (tm) was first advertised by the old muTek company as an April
fool joke. The sad, sad thing is that they had several inquiries...

That's because you failed to ask the right questions - you failed to show the other operators you were interested in conversing with them. Did you ask about their military experience? Did you ask if they had any patents? Their profession? What books they'd recently read? Their thoughts regarding solar or steam power? Chess? Did you try to learn *anything* from and/or about the other fellows? Once you find the what the other person is interested in, you'll gain quite a bit of knowledge in an area that you possibly knew nothing about prior to the QSO.

Look for a speciality net to check into, such as the old Astro-Net which used to be on 3885 kc - amateur astronomers in their backyards all peering at the same celestial body through their telescopes (with a name like Moonman, you would have fit right in...). Call CQ CHESS to hook up with another chess player. Turn down your power to say, 1 W, and try for the Thousand Mile Per Watt award (or the 10,000 MPW award).

Geez, the list is endless. Your problem is that you have no imagination! It's no wonder your QSOs appeared so boring to you; I can imagine how the other fellow felt!

Naw. No insight.
I DO have a lot of memories about people who said that first one thing
then another violated "all the laws of sciencs" when all that really meant
was a new application of those laws had been found.

LeTourneau wasn't back in the days of DeForest when the supposed
scientists got after him. Then after he revolutionized the Earth-Moving
machinery industry, the same scientists said it was obvious and nothing
new at all, LeTourneau had just taken an old idea and applied it where
it had not been applied before.

He laughed and agreed.

I have an insight that one week of ecperimental investigation of someone's
claims beats ten years of jabber not backed up by ANY investigation, and I see a
lot of the latter on these NGs.

sheesh.

4279. Homebrew DGPS Receiver Design Available

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-22 00:00:00 UTC
From: Jim Bixby <bix@brooktree.com>
Message-ID: <6hlrt9$6j4@not.abnormal.com>
Source record: 83647
Cross-posted to: rec.radio.amateur.homebrew,rec.boats.electronics,sci.geo.satellite-nav

Hi all.

I have posted a design for a high performance, manual DGPS receiver.
The infomation can be found at
http://web.abnormal.com/dgps/bix/

I want to thank Tim Hogard, who volunteered to provide a website for
the design.

This receiver should be buildable for around $100, and all of the
parts are available from Digikey or Newark. The most expensive parts
are a 16x2 backlit LCD display and the coils -- together these amount
to about half of the cost.

The project is not for the inexperienced -- it is 9 ICs including a
PIC 16F84 processor and is handwired, as there is no PC board design.
But it should perform as well or better than anything available.

If you build this receiver for yourself, I would be interested in
hearing about your results.

Catch that last paragraph, did we? :-) All he is pointing out is that 1dB of loss in a cable after the SWR meter will have the effect of reducing observed reflected power by 2dB. This happens only because the loss in the cable is bidirectional. The vendor is probably proving his cable "works" by demonstrating its ability to reduce SWR!

You could rig up a network analyzer to "try" it, but why bother? Except as an exercise for students, it'd be as pointless as using your VOM to observe Ohm's Law. However, with the level of electronics knowledge required of today's hams, I wouldn't be surprised if the cable vendor is selling that stuff by the furlong.

Lots of negative posts about biasing the class C circuits, but depending
on how good the linearity must be it is possible....
I have had moderately good results biasing the last two stages of a GE
Delta VHF 100+ watt PA. Power out must be derated... I get about 80
peak out and good audio / no splatter reports on 2M SSB (admittidly
haven't looked at it on a scope). The Delta is easy... At this level
there are 50 ohm inter stage points and the (normaly) zero biased bases
are connected to ground through a ferrite bead choke (and resistors if I
remember ok - if not, I added some low value to gnd). Lift the
bead-wire from ground and bypass very well. Apply bias to it.

On the other hand, a similar unit I tried at 70cm for use with ATV
yielded very poor results. ATV is, however, a very demanding service
and requires excellent linearity for a good signal. Plenty of power,
plenty of rotten quality :(

I desperately need some info (schematic layout, manufacturer) about a Ham Radio 2m VHF linear amp: Brand=Bias Electronics (urbania, Italy), Model=VHF 160

It's a black metal box with cooling frame on top, One switch (middle position off, down=SSB, up=FM) on front right, and two red LED's on the left ("on" and "tx"). There a double side PCB inside that looks a bit "home-brew" (maybe it's a KIT???).

The amp is based on a MRF 245 that should be able to do 250 watts (absolute max). 160 watts (see model) will probably what it's supposed to give me. It's doing now only 50 watts and switching (the relais) and vox is not working properly. While it looks quite simple on the inside, I'd like to give it a go and let the thing do it's normal job (QRO!).

For Dutch HAM's: Ik heb 'm gekocht van PA3FRD (Friesland?) uit nalatenschap van PA3EQU (silent key) op de markt in Meppel 1997. Misschien is daar nog wat info te vinden?

CAN ANYONE HELP PSE? PSE EMAIL TO: PE1RVK@VRZA.ORG

Tnx very much de PE1RVK (JO21WT)

I think this must go with the strong magnets that plumbers here are selling for about $200 to put around the water pipes as they enter the house. Seems to polarize the water and make it softer as well as removing corrosion in the pipes downstream.

Where are the magnetron magnets when I really need them?

4288. FS: SOLID STATE HF PA AMPS

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-23 00:00:00 UTC
From: Norman Hockler <norsan@bright.net>
Message-ID: <6hmm29cvb1@cletus.bright.net>
Source record: 83558

Hi All,

I have some solid state PA amps for sale. They come from
the medical field and are shown as 600 watt and were used
in a pulsed mode. I have operated them at 400 watts for
short periods of time and the heat sink is much to small
for continuous operation and will need changed or a fan
added for SSB operation. They require 48 vdc for main power
and 5 vdc for bias. BNC in and out. Uses 3 transistors,
1 driver and 2 bipolar in the finals.
The transistors are rated to 30 mc, however, output at 30 mc
is very low. Unit has max output at around 14 mc...
I think the 2 transformers are not broad banded enough and
would need to be rewound or the c changed to get a wider
bandwidth. There is no output filtering and would need to
be added if you used alone or would make great driver for
larger tube amp.

Cost is $95 including shipping...contact me direct for
further information.

I presume the "vendor" gave this presentation in a business environment (at your place of work, maybe?). Why must we theorize or spend a lot of bandwidth thinking about possibility? This claim is so completely measurable as to defy logic.

Just tell the vendor to let you test a piece of it - in fact ask him to provide you with the test procedure so you can "duplicate his results". This usually stops the BS immediately!

I doubt if he is referring to "return loss", which equates to VSWR, since this number is better when larger.

Perhaps you are dignifying a snake oil salesman by referring to him as a vendor. In that case, this method won't work, since he has no credibility to challenge and won't directly answer your questions anyway.

I have. I've spent years working with coax and dealing with its loss. (Among other things, I designed the circuitry to equalize the delay line loss for those of Tektronix's 11800 and TDS800 series of high-speed sampling oscilloscopes which use delay lines. One design compensates a line from DC to 2 GHz, another from DC to 6 GHz.) The now-known laws of science have served me well, and the results I've achieved by depending on them speak for themselves.

I've also spent a lot of time characterizing and measuring ferrites at radio frequencies. So my judgement of the ferrite-loaded coax was based not only on science, but on years of observation, measurements, and experience. And, as has always happened for me, the observations, measurements, and experience agree with the science.

Tell you what. If you'd care to buy this person's merchadise and test it, I'll reimburse you double its cost if the loss claims are true. Ok? No, make that quadruple.

I no time, Leroy, but I too have had years of experience, at a lot of stuff
beginning as a child and going thru AF radio school then into research,
and even design. What all this has taught me is that I don't know s**t
about radio, which putrs me in line with Einstein, who said that the more
he learned about the macrocosm and microcosm, the more appalled he
became at his own ignorance.

I too many projects now, which have a direct bearing on something I am
trying to accomplish, and I don't need to satisfy curiosity.
I can think of a couple ways the ferrite beads might help, and if I ever happen
on time and inclination at the same time, I will test the ideas, but until I
know the idea works, I will not say I think it does.

What I HAVE said is that the stuff written here does not include anyone
having tested these claims before mouthing off. That's ALL I have said,
however I may have said it.

Sheesh again.

Al, I left your entire thing in the bandwidth of my reply because I
wanted everyone to be able to see good work in a bunch.

Yours is the first reply that I would call scientific in its advice.

I do not exclude my own advice from that condemnation, because
I did not give good advice about how to do it, I just snarled at the
naysaying of others.

Your answer is what I wish I had the good sense to have written.

Or, more briefly,
"I wish I had said that."
Keep it up.

You don't need them. What you need is to trap the magneto-
chargeable particles into a separate pit, rather than just tuberculating
them out on the wall of your pipe.
>
>N0UU

I have seen this done, aned it is like the super-lean auto gas. It will work,
BUT if you don't prepare well, it will eventually damage your system, be
it pipes or an engine.

To study this stuff about pipes look into the particulate separation work
done by Eriez Magnetics (cf) and others.

Also study electrostatic film deposition, and particulate precipitation.

The magnets might work as specified, but you said nothing about
whether they would eventually plug your pipe near the magnet.

have a nice day.

There's a simple answer to this question. Chop off the ends with the ferrite beads and what have you got? - an arbitrary length of lossy coax. So the only way you could end up with zero loss is if the beads were active devices providing a positive gain which they clearly are not. QED.

Livermore is held the first Sunday of each month, year round, and
starts at 7 AM sharp (check QST for additional info).

Foothill is the second Saturday of each month, except during
winter (I believe it stops either in September or October).
Get there early with a flashlight and join the "Flashlight
Brigade!" The swapmeet is held at Foothill College, in
Los Altos.

There's also the CHRS (California Historical Radio Society)
meets held once a quarter, also at Foothill college. They're
very small affairs, though. Do a web-page search for CHRS
for more info.

At the Green Country Hamfest, I got a little round antenna.
It looks like a DDrr, but I am not familiar with little ones.
I had seen one like it on a commercial rig, and the owner
said he got real good range from it.

Now I own one, and don't even know where to go looking for
information on it.
I gave my antenna book to my daughter, and the ARRL
handbooks I have don't mention it.

This is not made of tubing, it is a flat plate that was cut into
a sort of ring radiator, but no gamma match. It has a disc on
a screw that is most likely the match cap, but I don't know
how it works. I need data, and references I can look up.

Can/will anyone gimmie some hints?

TIA

N0UU

I know this has been gone into before - ad nauseam - but I don't think a magnetic field can alter the water molecule itself.

However, I AM willing to listen to evidence for the magnetic field acting on MOVING water, to alter the properties of the salts dissolved in the water.

I wouldn't go so far as paying for such a device though.

To be fair, there WAS a time when I didn't believe in dowsing. I'm beginning to believe that water breaks most of the laws of nature.

: Sounds cool. What does "Manual DGPS" mean?
It means that you have to push a "tune up" or a "tune down" button if you
don't like the frequency its trying to use.

Since the code for the PIC is included, it might not take too much work to
get it to work transparently with some other GPS recivers like the Garmin
which has the ability to send tuning request to a dgps reciever.

Well the Garmin might send tune commands to the radio, buy at least on
the garmins I've tried it with there was nothing automatic about the
garmins tuning the radio. In effect the buttons were just moved from
the radio to the gps. Not much of a difference if you ask me.

Hi Wolfgang -

If the DGPS receiver is located 10' away from the GPS unit (e.g. Eagle's DGPS sex toy) or it's buried inside the center console of a boat, being able to tune the beacon rcvr from the GPS *is* a major convenience. It should be noted, however, that you probably wouldn't be constantly changing the tuning of the beacon freq (unless your tooling along at Mach 2 or so ;o).

I'm probably going to build Jim's unit just to mess around with it - might even try to build a PC board for it. Thanx Jim for putting it up for general use!

JMHO and Regards - Ted H

Well, my Mercury is a Tracer. ;-) I try to stay below mach 2 since my gps-130 blanks at 99mph. Actually, I'm not sure if it really blanks at 99mph or not. I once tried to test that claim, but I only managed to make it to 95 mph in the distance between overpasses. (I have a firm rule that I don't speed past overpasses -- the shadows behind them often hide some very unfriendly creatures.)

Driving up the coast of California requires bi-hourly frequency changes. Futzing with the charts, finding the next station and playing scroll-the-numbers games to get to the next station is not exactly "user-freindly". I really long for the two-channel dgps-on-an-oem card such as CSI SBX-2 http://www.csi-dgps.com/ .

Got your point --

But, 95 MPH in a Tracer would rattle my teeth! ;o]

My DGPS usage is more geared to boating (35 kts max). I have little crib sheet labels stuck to the front of my GPSMAP-230 with the beacon locs (NY to NC), their freqs and their bit rates. The 230 has a DGPS beacon log that keeps tabs of what beacons you've tuned to and it's fairly quickly accessible from the menus - tuning's about 3 or 4 key strokes. Where I boat, the local beacon station is only about 10 NM from where I go out into the ocean - I've never had to re-tune to get a valid signal 25 miles out or up and down the coastline. I can see where land travel would introduce some terrain signal degradation problems.

It's funny, the Eagle instructions tell you to turn off auto beacon selection if your GPS has the facility - ya'd have to tune it manually anyway.

Curiosity - does bi-hourly mean twice per hour or once every two hours?

I'll check out the URL you posted for info. Well, don't let them thar' CHIPs getcha.

Pardon my ignorance, I really ought to be looking for this info in DejaNews or an FAQ somewhere, but I guess I'm not 100% clear on just what a DGPS receiver *does*.

I understand there are fixed land stations (Operated by whom? USCG? Receivable from where? Everywhere in CONUS?) that broadcast correction signals in the LF band to restore the (full? partial?) GPS accuracy that is otherwise intentionally degraded by the Defense Department. From the context of the discussion, I take it that at least some commercial GPS receivers have a port which can be connected to a DGPS receiver to obtain full military accuracy? Or is the accuracy still somewhat degraded?

Further, these receivers, once "enhanced" with a DGPS signal input from a separate receiver, have sufficient resolution and response time as to determine your current speed to +/- a few MPH when driving or flying?

Besides the improvement in absolute accuracy, what other advantages does a GPS user obtain through the use of a DGPS receiver? Is the

speed-measuring feature even possible without DGPS?

That sounds pretty nifty, if so. Am I understanding it right?

I too am confused. Does this mean that if I get a GPS unit, and a
DGPS add-on, and fiddle with it a lot, I can have something that measures my
speed
almost as accurately as my spedometer?
Cool!
Now I won't have to rely on the policeman to tell me how fast I was going. :-)

yep. Your tax dollars (and interdepartmental infighting) at work.

> Receivable from where? Everywhere in CONUS?)

Mostly the whole continental US. Some of the mid-west is missing.
Check the DGPS map page at:

http://www.csi-dgps.com/

> that broadcast correction signals in the LF band to restore the
> (full? partial?) GPS accuracy that is otherwise intentionally
> degraded by the Defense Department.

Actually and ironically, it "restores" to better than the degraded
signal. A good example of how DOD stubbornness forced people to do
something that was actually better than the initial undegraded
solution.

The exact reason for the increased accuracy is that the differential
solution actually measures the ionospheric offsets, instead of the
open-circuited undegraded case where one would apply an estimated
fudge-amount.

> From the context of the discussion, I take it that at least some
> commercial GPS receivers have a port which can be connected to a
> DGPS receiver to obtain full military accuracy? Or is the accuracy
> still somewhat degraded?

Many gps's have such a port. Looks for advertising such as
"differential ready".

> Further, these receivers, once "enhanced" with a DGPS signal input
> from a separate receiver, have sufficient resolution and response
> time as to determine your current speed to +/- a few MPH when
> driving or flying?

One can get accuracies in the order of a few meters horizontally and
vertically. The speed appears to be good to ~1 mph. Dgps doesn't do
as good a job with fixing up the speed as position offsets.

> Besides the improvement in absolute accuracy, what other advantages does
> a GPS user obtain through the use of a DGPS receiver? Is the
> speed-measuring feature even possible without DGPS?

Basically it allows the gps to be a fairly accurate altimeter.
Without dgps, the altitude readout is useless with +/- 150 meters max
of SA-induced LF noise (usually +/- 75 meters in practice).

> That sounds pretty nifty, if so. Am I understanding it right?

It is a fun hack. The car gps/dgps doesn't quite let me drive under
IFR conditions, but its darn close. +/- 1 lane accuracy is what I see
under normal conditions.

And don't forget that it can be had for about $75 bucks if you shop a bit
for the parts. That's LOTS cheaper then the commercial units. Jim also
states in his instructions that the circuit can be modified to possibly
allow automated(?) control. Or you can simply wire-in remote tuning buttons
wherever your GPS unit is located.

Michael-

You only need the HTX-100 service manual. If I'm right, the part numbers listed are Uniden numbers, which should be available from their service department.

Are you sure the coils aren't available from Tandy? I've bought parts for some pretty old stuff before.

He replied:

I think you are right and there is an optimum temp for oxide coated
cathodes. The low work function leaves a "gas" of electrons surrounding the
cathode which makes a significant difference to the valve characteristics.
Running cool must change that to depleted "gas". Could be emmision from
inside cathode oxide layer through a greater local potential gradient
causes energy dissipation in the layer with perhaps mechanical flaking of
the oxide.

I vaguely remember that this was shown to be a real cause of failure but
cannot be positive about it.

If boosting worked good luck; it probably gave a short increase in life
span like cooking old dry batteries in the oven. The long term solution is
a new tube or tele.

I worked in a TV shop during the 50's and sold a lot of those CRT boosters. They were cheap compared to tube replacement and many customers took the gamble after being informed of the possible outcomes. I was amazed how much they often improved the picture. I never had a filament burn out using them. Most of the time you just gained a few months before the picture got worse again. But by this time the customer had saved up for the replacement, or replaced the set.

> following the DSP. Or am I missing something here?
>

It's worse than even that. If the DSP is making a significant contribution to the RX selectivity, then the DSP filter is narrower than the analogue bandwidth from the antenna to the ADC. You can get dynamic range in the DSP engine relatively easily, it's the ADC that is the bottleneck. This means that the prime determiner of dynamic range lies before the prime selectivity. AGC can help under favourable conditions, but when trying to handle a small signal in the presence of strong ones at nearby frequencies, the available dynamic range is simply that of the ADC. This effect is just like the problems of certain radios that had upconverting structures and weak second mixers. Performance for well-separated signals was OK, but close stuff could pass the first IF filter and block/intermod at the second mixer.

Some of the current crop of "DSP" transceivers have dynamic ranges that drop to 80dB or less when interferers enter their analogue bandwidths.

> effects.
>

It's possible to add out-of-DSP-filter's-band noise to dither an ADC
and then rely on the DSP filter removing the stuff, leaving just the
effect of increased resolution, as described.

A second technique is to make the dithering noise digitally with a
"PRBS" pseudo-random number generator driving a DAC. The digital signal
that drives the DAC can be passed to the DSP and then subtracted from
the signal, thus removing the dither after it has served its purpose.
Naturally the subtraction won't be perfect, but with the dither at a few
LSBs, it's easy to get it good enough for a worthwhile improvement.

Dither improves the effective resolution of an ADC process, and reduces
the quantisation noise level but it doesn't do much about the
non-linearity/SFDR.

Cheers

>and 1000 ohms.
This may be implied in your statement "Impedance" however when the
termination appears to be about 1000 ohms resistive it will often in
reality be 1000 (or 920) in parallel with 5 to 20 pf this was done at
the OEMs request to allow for strays in the pcb track. If you have a
tracking generator is should be possible to get better than the orig
spec for ripple as you can tweak for optimum rather than standard match.
By the way rather than pay for trimmer caps it is / was common practise
for filter makers to employ pairs of twisted enamelled copper wire more
twists more cap! (a good tip for low value presets).

Hi.
RF parts? I usually use RF Parts, their phone is available from
8005551212, although last xsistor[RF] I needed was cheaper from Dalbani
[Miami, fl.] # also available from 800 info.
Good Luck,
A J

Nice Clegg Venus 6m SSB transceiver. Condition 6/7 on 10.

Operations are good although there is a short term +/- drift, due to a possible cold solder connection, corroded tube pin or etc..

Modified National power supply included.

$175.00 + shipping/offer

Could someone out there tell me how switching power supplies work? I have not been an electronics technician very long and I do not understand them yet. I do not have a technician close to ask for help. I am out in the middle of nowhere in Colorado. Maybe you have a book that you know about that I could buy from a publisher. This is very important to me because I have 5 of these power supplies that I am working on right now. I would really appreciate all the help I can get. Thankyou!!

No. But good guess. I have figured out the wiring after taking a
good look at the circuit board and getting a hint from a friend.
The wires are as follows:
Black, White, Shield = Ground
Red, Yellow = +V (12v seems to work for me)
Brown = Audio input
Green = Mute (apply +V to unmute speaker)

I have the following power tubes for sale. I know what they sell for new, but I am entertaining offers. Make me an fair offer.

Qty. of 2 Eimac 100th in factory boxes, 1 sealed box, opened other to verify content. New old stock.

Qty. of 2 Eimac 4-65A in sealed factory boxes. New old stock.

Qty. of 1 Eimac 4-1000A, appears to be new and unused, no splatter, discoloration, etc.

Qty. of 1 Eimac 4-1000A, a few faint stains on the glass, no splatter, etc. Looks almost as good as the one above.

Qty. of 1 Eimac 3-1000A, appears to be new and unused, no splatter, discoloration, et.

Qty. of 2 United 805, in factory boxes. New old stock.

Qty. of 1 Eimac 4X250B, in sealed plastic pouch. New old stock.

Also have a Jennings UCS-500 10KV vacumn variable, appears to have never been mounted, make offer.

I'm not selling this stuff to put food on the table, so if you are interested, make me a fair offer. I want to be fair to you and me. Email direct if interested, thanks.

I'm not entirely clear on the need to 'retune' the DGPS unit every couple of hours. Is that strictly a marine issue or does it also apply to driving. Say I want to drive from San Francisco, California to Seattle, Washington. 1)How many times would I need to change the 'channel', 2) how would I know when to make the change, 3) and how do I know what channel to go to next?

Thanks!

Ok, this is kinda stupid, but..... Have a friend with dual band radio, remote head. Not sure, but think it's an Alinco (about 8 yrs old) if not, it's kenwood, either way, this should be a generic question. Concerning the 'new' push and hold for what I suppose is relayed power on/off like most newer radios are, what would make this radio refuse to turn off?? It had to be wired thru ignition switch so it will turn off and on with the vehicle. Radio works perfectly, but it just won't turn off! Ohm meter says the switch itself on the control head is fine. any ideas??
thanks,
Randy

>

Oh really.... Let's take an example and see whether what "everybody knows or should know" is true:

Assume a lossless coax (any length) with a 50 ohm termination on the far end. For this condition, the return loss is infinite and the VSWR is 1:1.

Now, let's introduce some "loss". You can use a ferrite bead, I'm gonna use a "pure loss" i.e., a 50 ohm resistor in series with the input to the line. My my! The return loss is now ~9.5 dB or VSWR = 2.0:1.

Well, "everybody" knows that more loss gives a better match, so we must need some more loss. Let's use 100 ohm. Hmmm. This ain't workin' out. The return loss is 6 dB for a VSWR of 3:1.

@*&^&@($*?+&* I'll fix it, I'll make the loss infinitely high by introducing an infinite resistance in series with the line. There by golly, that ought to do it.... Well shucks.

Sorry to rain on you Dana, but the same is true with ferrites. They do also have an (often overlooked) inductive component, so even if "loss" really helped, the inductive part will hurt, unless the load just happens to be capacitive.

I am looking at taking my Tech-Plus test sometime in the near future. I would therefore like some information about a good starter radio to begin with. It does not have to be solid state, tubes are fine. I do not want to spend too much money at the moment. I would like a radio that covers the bands which Tech Plus allows or at least the bands which tech covers minus CW. I am mainly looking at getting a base model radio.

Any information from anyone would be greatly appreciated. If you have something for sale that might fit the bill , let me know.

I would also be interested in homebrew equipment or plans to construct a radio.

Thanks,

Chris

>
>
indeed they are 'fragile' - if this is the right word for it
we used 4x 8122 in 6 TX's for coast stations in this area. You must
check every valve for screen to controlgrid short circuit using a VOM,
up to 30% of the delivered goods showed this failure, and we could not
return them to the manufacturer! Similar experience applies for the
Danish manufacturer 'Sailor' which used 8122 in earlier shortwave
transmitter.

*** First time you test av valve be sure to run it with heater only for
at least one hour. But still some valves will have inter-electrode
short-circuit during first tests, so it is indeed a time-consuming
affair to find 4 valves to use in each transmitter.
*** Run the new valve with anode- and gridbias voltages, without screen
voltage for some hours.
*** It is important to use some grid bias circuit which will immediately
switch off the transmitter when screen-control grid shortcircuit occur,
or at least use some low resistance back-up negative grid voltage in
parallell with the variable, 18V transformer with 1N4007 diode, 1000uF
filter capacitor and a second 1N4007 gate diode (normally biassed off)
is a suggestion for secondary bias voltage to avoid screen voltage go
into the bias of the parallell valves (it is bad enough to ruin one
valve!)
*** To avoid possible control positive grid voltage, and burn-out of
another parallel 8122 valve the addition of an 1N4007 as grid reverse
polarity protection is also a good idea to add.

I have over two douzens unused type 8122 valves, but I would never vaste
the time trying to use them, I would rather use 4CX250B, the ceramic

power valves contains beryllium oxide, and must not be thrown in the rubbish bin. Poor me!!!

Stick a big silicon diode in series with about 10 ohms from base to ground.
Thermally couple the diode to the transistor.
Put a variable resistor from base to +12 and set the collector current at about a
third of
the maximum current the transistor can run.
Then you take a scope with enough bandwidth to look at the RF. Drive the
transmitter audio with
a triangle waveform. Tweek on the bias until the output is linear.
If it gets linear enough at low enough dissipation, you're home free.
I suspect there are some two-tone tests that can be done with less equipment.
Check the handbook.
You can also start at zero bias and tweek the current up until the splatter goes
away.
Or you could sell the amp to an FM-er and buy an AB amp.

Like to play with electronics and PC's ?

This is for you.....

Control eight separate relays with your PC printer port !

Each individually programmable in Windows 32 bit environment.

Choose "Timed" Mode or "Interval" Mode.Infinetly variable.

Only four components per channel are needed.

Opto-isolated to protect your PC from "mistakes"

Full "WIN 95" style help files and construction details with graphics.

Convert the printer port into "Read" mode for A/D converter with one push
of a button.

Analog to digital converter plans and circuit.

You can download just the help files with construction details
or the full package inc. the help files.

NOTE: 32 bit Windows version ONLY.

Point your browser to:

Chris:

Any number of rigs probably will work just fine for you. For my money I
favor the Kenwood TS-830S. All solid state except a common 12BY7A
driver
and two robust 6146B finals. I have had one about a year and a half and
love it ! I am a Tech+ just moving on to General/Advanced as soon as I
take the 13wpm cw test (May 2, hopefully) but had sort of a good
electronics
knowledge when I started (lic. in April 97) so most of the rigs features
were
not foreign to me. Not that it's a difficult rig to learn (IMHO)....
but if
you get one work with it and see if you can find an Elmer who has
knowledge
of one to help you. The TS-830S has a very "hot" rx section and 100
watts
output (actually in tune and with good tubes 100 to 125 on mine
depending on
the band). This rig gives up little (if anything) to most modern rigs
except
DSP.... Elmer's are not real hard to find for the 830 (or for that
matter any
of the X30's - 530,830,930) seems like most hams had one at one
time..... and
if they still don't they regret selling it <grin>. Only thing is you
have to
get used to tuning when you change freq a few khz.... but then thats
really no
trouble for me and it's a fact of live with all tube final rigs (or
amps).

My local manufacturer has stopped producing a spray-on photoresist for making PCBs. I used it not so much for manufacturing PCBs as for making sundials.

Somebody told me that a photoresist-coated acetate or mylar film is available which one can stick onto the metal, expose through a design, develop and etch. Does anyone know what I am talking about and if so, who manufactures it or sells it.

Any help will be much appreciated.

> Mike, do you know the answer ?

Halted Specialties Corp (HSC) is at 3500 Ryder Street, Santa Clara.

I usually go there from 101 and take the Laurence Expressway to the
Central Expressway. Ryder is the first right turn after crossing over
Laurence Expressway. You can also get there by turning East on Kifer
Road and left on Copper Way. At Copper Way and Kifer Road is one
of the Advanced Component Electronics (ACE) stores. It's worth a
visit too but it is only open on weekdays. Their other store in SJ is
open on Saturday.

Regards,

Dave

Dalbani is very reasonably priced, but the RF choices are a bit limited:
USA 1-800-325-2264
email savings@dalbani.com

Richardson Electronics is lower priced than many but requires a high
minimum order, like $100 or so: (a small amount of RF power devices will
meet this minimum normally)
http://www.rfgain.com/
1-800-737-6937

RF Parts in San Marcos CA has a good selection but very high prices:
1-800-737-2787
http://www.rfparts.com/

4379. Performance: Anti-parallel diode subharmonic mixer? (RA3AAE type)

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-25 00:00:00 UTC
From: la8ak@xnd.no
Message-ID: <354129e5.20532049@news.sol.no>
Source record: 83536
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

G3SEK (Ian White) might have requested IM performance for this type mixer, but I have not noticed any replies.

Believe it was an article about application on 23cm in Ham-Radio. But several sources - without good reasons - claim it is bad in many respects (typical argument is "I don't know it so it cannot be good").

The only other references is
1) used in 7/10MHz DC receiver I built a few years ago, and
2) a bilateral 14 <-> 144 transverter I built 10 years ago.
3) DB6NT uses the design for his 24GHz transverter.

We measured 7dB conversion loss on my 2m transverter - in any direction, 2x 1N4148 were used in any of my designs. It is easy to achieve good conversion gain provided you keep the termination impedance of the diodes low for all other frequencies than the one to pass, if not the conversion gain may be bad. I am not certain which influence this has on IM performance.
It is important with DC receivers that the LO has no output on the RX input frequency. I did not use proper mixer output network and did have some crossmodulation from AM broadcast transmitters, with a 2x 2N3904 cascode RF amplifier I could easily hear a 0.1uV cw signal.

: It's true, 12 feet of RG-58 is low loss! Even without the ferrite beads.

Yeah, but not THAT low loss. Expect about 4dB in 12 feet at 2.4GHz. And
of course, "negligible" is in the eyes of the beholder.

Starting where? Assume NO ideas at all?

You need something which makes a contact when you press it (or, if you are into high speed stuff already, hold it to one side - but I would not START there).

Maybe find a knob (off an old domestic boatanchor?) which suits your "fist", first? Then find what spring strength and distance suits you? Or work out some sort of adjustable lever and spring, so that you can adjust the force needed, and the distance your fist travels, from day to day.

Next, know what is the MAXIMUM current you wish to interrupt, and the MAXIMUM voltage which will be across the contacts when the thing is "open".

You will then almost certainly decide you need the key to be well insulated, because cathode keying, which is very common for starters, entails full HT voltage appearing across the points when the key is open.

(Not so risky if you are using a sand-state transmitter.)

Why not look at drawings in old books? Then copy, using modern materials.

Needn't cost a thing (except your life, if you are careless.)

David Stockton wrote:

[deletions]

> Some of the current crop of "DSP" transceivers have dynamic ranges that
> drop to 80dB or less when interferers enter their analogue bandwidths.

Yes. Just so tuners-in won't miscontrue this as an artifact of "DSP" radios--I can almost hear the Lore Machine whirring into action now!--most all-analog radios, including those based on the vaunted vacuum tubes, also have a "close-in" dynamic range in the eighties and down, as Sherwood Engineering's receiver performance table, http://sherweng.com/table.html, reflects. The maxim, "Keep the selectivity as close to the antenna as possible" (which I credit as originating in the amateur literature with Byron Goodman, W1DX, in the late 50s), still holds.

What may seem like a conundrum to those who consider DSP a magic bullet that will ultimately do away with all of those nasty analog RF-handling stages (and their engineers :-D) is that the spectrum that rides in through the antenna connector is an *analog* spectrum with a vast dynamic range--even a spectrum in which all-made signals are "digital" is converted into an analog spectrum by fading, noise, and variability in in arriving-signal powers attributable to path length (co-located to more than half the world away) and differences in transmitter power--and that the more of that dynamic range the ADC must experience, the better the *analog* performance the DSP front end must have.

I think that we'll long choose to protect "DSP" receivers with some form of analog, feedback AGC for the simple reason that analog stages overload gracefully, and DSP system don't. An analog IF stage driven into compression by a signal at one frequency (say, a strong signal that ends up out-of-passband downstream) may nonetheless simultaneously provide useful output from another, weaker signal (in-passband downstream), whereas an ADC subjected to a signal beyond its numerical range doesn't.

From: CARL DOMANICO <cmd-dell@worldnet.att.net>
Message-ID: <6ht689$93s@bgtnsc02.worldnet.att.net>
Source record: 83548

I recently Purchased a Kenwood MC-60A Amplified Desk Microphone. I would like to hook up this Microphone and my Kenwood Stock Microphone to my TM-741A Mobile Radio and be able to Switch from one to another. Since there are times when I need to use the Touch Tone Pad built into the Stock Microphone.
The easiest way to accomplish this would be to use the Kenwood MJ-88 Modular to 8 Pin Microphone Adapter, since the Desk Mic, comes with that Round 8 Pin Connector. Then to enable me to Switch from one Microphone to the other the Kenwood MJ-89 would most likely fill the bill. Now based on the price of $50 I paid for the Desk Micï¿½comparing that to an investment of $30.95 for the MJ-88 and $69.95 for the MJ-89 which would exceed $100 less shipping from a mail
order house..AES or HROï¿½.it seems Prohibitive based on cost for Connections.
I wonder if someone, maybe a fellow Amateur Radio Operator, could answer these questions?? Also possibly give me some input on a small construction Project?? I would like to build a replica of the Kenwood MJ-89 Mic Switch..it consists of a Small Plasiic box, housing 2 Female 8 conductor Modular Jacks, It uses a Switch located on top to go from one mic to the other...the output is a 8 inch or so 8 conductor Mic cable with a male 8 conductor Modular Plug, which would plug into the TM-741A Mobile Radio...I would need to know exactly what part number the female modular jacks are.?..also What part number the Male Modular Jacks are..?. What Switch I would need???...When I say part number I mean exactly what are the specifications I need on these parts needed to construct this Switch Box..?? Also...As far as Installing the male Modular Jack on the Mic Cable...I see they use some sort of Crimp Tool to do this...Do I actually need one for only a couple of connectors? Or could I get away with a electronics Pliers to Crimp the male jacks on??

Everyone & Anyone who could supply me with the info to accomplish this little project shall be greatly appreciated...

Thanks Very Much,
Carl Domanico N2MFW

NTE sells a 10.245Mhz Crystal under their part # NTE654, I think ECG
probably does as well. The good news is that you can get them from any
local electronics supplier that sells NTE semiconductors, even though they
may not know that they have it. I just used one in a VHF marine radio and
have also used them to repair old regency slope fronts. They work perfectly
in any application using an mc 3357/3359 or similar dual conversion 10.7/455
setups.

They closed down/moved last year, they were having a closing down sale at the time. This year I was only interested in HRO and Fry's. Halted is also a good place to visit, Mike's taken me there once, I think it's on Central Expressway, left off Lawrence.
Mike, do you know the answer ?

It's not for sale, but I just bought a 1971 edition at a Rotary Club garage sale today. That edition was the first that I ever bought, and one of the first technical books I ever bought, back in 1971 when I was 11. Cover price was only $4.50; I paid twenty cents today. A few years after I bought it, I gave it to someone who was interested in amateur radio, thinking it wouldn't matter since I had later editions. But I know recently I had a desire to get that edition back. This one has a different color from what I remember, it's probably faded, and the cover is in much better shape. The last time I remember my 1971 edition, the cover was in bad shape, and surely it had plenty of solder burns.

You might go to http://www.arrl.org and go through the list of upcoming hamfests. If there's one near you, you're bound to find a used copy there, and at a good price. Or talk to your local ham club to start a compaign to put a recent edition in the local library, and maybe you can get the older edition that hopefully is already at the library.

Transmitted right along with the beacon signal, yes.

>> From the
>> context of the discussion, I take it that at least some commercial GPS
>> receivers have a port which can be connected to a DGPS receiver to
>> obtain full military accuracy? Or is the accuracy still somewhat
>> degraded?

I believe it actually can give better then military accuracy. USCG gives a rating of (i believe) 10 meter 2D accuracy. 5 meter and better common.

>> Further, these receivers, once "enhanced" with a DGPS signal input from
>> a separate receiver, have sufficient resolution and response time as to
>> determine your current speed to +/- a few MPH when driving or flying?

GPS is already very accurate (within a couple of MPH) at typical automotive and aircraft speeds, dGPS only makes it more so. It does however greatly increase the ability to accurately track slow vehicles (ie hikers and boaters).

>> Besides the improvement in absolute accuracy, what other advantages does
>> a GPS user obtain through the use of a DGPS receiver? Is the
>> speed-measuring feature even possible without DGPS?

See last statement. Yes.

>> That sounds pretty nifty, if so. Am I understanding it right?

I'd say overall yes. Yep, nifty stuff indeed.

>I too am confused. Does this mean that if I get a GPS unit, and a DGPS add-on,
>and fiddle with it a lot, I can have something that measures my speed almost as
>accurately as my spedometer? Cool!

Adjustment of the beacon frequency would not be frequent under normal circumstances. Of course if you don't want or need 10 times better accuracy don't bother with one. BTW, you automobile speedometer can be off by up to

+/- 5 MPH.

rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.noncomm

***** DON'T PANIC!!!! *****

***** READ ENTIRE MESSAGE FIRST!!!! *****

The following message is an announcement of a 30-day discussion period on news.groups to precede a non-binding opinion poll which, depending on the results, MAY lead to a formal Request for Discussion (RFD) to reorganize the rec.radio.amateur.* newsgroups. NO VOTES ARE BEING TAKEN AT THIS TIME, and any binding vote that affects the rec.radio.amateur.* newsgroups will not occur for many months into the future, if at all. Please read the entire announcement carefully before replying or following up.

rec.radio.amateur.* Vote of Confidence

Contents:

Q: Who is doing this?
Q: How may I join the rra-wg?
Q: Why are we doing this?
Q: What are we doing?
Q: More to the point, why are we "kicking over this hornet's nest?"
Q: Why do you want to change the newsgroups again?
Q: Who are you to tell us what to do with "our" newsgroup?
Q: How long ago were each of the rec.radio.amateur.* newsgroups created?
Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this proposed opinion poll?
Q: Where can I obtain a copy of the original newsgroup charters?
Q: Where can I find out more information about the Usenet RFD/CFV process?
Q: I don't want any of the newsgroups to change. What should I do?
Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?
Q: I support some of the newsgroups for amateur radio, but not others. What should I do?
Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?
Q: I would like new newsgroups to be created, what should I do?
Q: I have no opinion, what should I do?

Q: Who is doing this?

The rec.radio.amateur.* Working Group (rra-wg@theporch.com, which initiated the last major reorganization in 1993) is the point-of-contact

for questions about this proposed opinion poll. Principal members are Paul W. Schleck, K3FU, and Jeffrey Herman, KH2PZ. Though not an rra-wg member, Gary Coffman, KE4ZV, also endorses this proposed opinion poll. The proposed opinion poll will be conducted by an unbiased third party from the Usenet Volunteer Votetakers (UVV), Jeremy Billones (billones@primenet.com).

Q: How may I join the rra-wg?

Anyone who volunteers may join the rra-wg. The rra-wg has always solicited volunteers from when it was created in 1993 (originally named rra-reorg) to draft an RFD to reorganize the rec.radio.amateur.* newsgroups (and continues to serve as an advisory group for FAQ maintainers and new newsgroup proponents). You may join the rra-wg by subscribing to its mailing list.

The automated list manager address is

listproc@theporch.com

Use this for subscribing, unsubscribing, getting archived info, getting the FAQ message, changing your address, etc.

To subscribe, send a message to this address with "subscribe rra-wg <your name>" Similarly, to unsubscribe, replace "subscribe" with "unsubscribe"

The list owner address is

listown@jackatak.theporch.com

Use this address only when there is a problem which really truly can't be resolved otherwise.

Q: Why are we doing this?

Discussion on the rec.radio.amateur.* newsgroups shows that there is a difference of opinion about the current newsgroups and their charters. Assertions on one side of the argument that the charters were voted upon by the readers have been countered with assertions on the other side that the votes took place years ago, by a very small minority of the current readership. There is also the strongly-held opinion among some that we have "too many newsgroups." The following is a sample posting from the discussion thread on rec.radio.amateur.misc that led to this proposed opinion poll (the entire thread may be viewed at DejaNews, http://www.dejanews.com/):

Q: What are we doing?

As a preliminary (and perhaps even diverting) step to an RFD (which would be very laborous and time-consuming, and perhaps unnecessary), we propose to conduct a Straw Poll, or "Vote of Confidence" (similar to the vote of confidence for a Prime Minister made by British Parliament, or a non-binding resolution of the U.S. Congress). We do it Usenet-vote style (utilizing a neutral vote-taker from the UVV) with an RFD and Call For Votes (CFV) period. During the RFD, we have discussion pro and con about each newsgroup and its charter. During the CFV, a vote is taken where a "Vote of Confidence" yeah or nay for each newsgroup, as currently constituted and chartered, is given by each voter (YES/NO/CANCEL/ABSTAIN votes are valid).

What votes mean:

YES: I support the existence of this newsgroup and its charter

NO: I believe that this newsgroup's existence or its charter should be reconsidered in a future RFD/CFV

CANCEL: Delete any previous votes I made concerning this newsgroup

ABSTAIN: I have no opinion concerning this newsgroup

Each newsgroup that does not pass a vote of confidence by Usenet voting standards (2/3 and 100 vote majority of YES versus NO votes) may be referred to the Usenet newsgroup creation process where their deletion or modification (based on a rough consensus of the 30 days of discussion and how much they lost in the vote of confidence) is proposed. Each newsgroup that does pass a vote of confidence will have its charter, and justification for existence, reinforced to the readership (as the current readership voted on it).

Q: More to the point, why are we "kicking over this hornet's nest?"

Sometimes hornet's nests can get big enough that they wind up falling down anyway. As shown in the thread above, there are significant undercurrents of disagreement over the current newsgroups, their charters, and even the suggested guidelines and rules of net-etiquette that many on the newsgroups advocate. If the proposed opinion poll shows strong agreement with current practices, then that would help reduce (though not eliminate) newsgroup arguments on the subject. If, however, the proposed opinion poll shows strong disagreement, then it's probably better that we know that right away, and take steps to fix the current situation before it degrades any further.

Q: Why do you want to change the newsgroups again?

Only some of the proponents of this proposed opinion poll wish to change the newsgroups. Some wish to simply have the current newsgroups and their charters reinforced. All of the proponents agree that an up-to-date opinion poll of the readership is desirable at this time. Whatever future actions will be taken will be determined by the results of this proposed opinion poll.

Q: Who are you to tell us what to do with "our" newsgroup?

One answer is that on Usenet, no one "owns" an unmoderated newsgroup. Newsgroups are voted into existence by a democratic process to determine consensus (and lack of significant objection) for using shared network resources to support them. All of the existing rec.radio.amateur.* newsgroups passed such a vote at some time in the past, and should pass such a vote again if there is strong support for their continued existence.

Another answer is that this is just a non-binding opinion poll of the readership to determine a consensus, if any, for making changes. It would still be necessary to undertake a formal RFD/CFV process to change any Usenet newsgroup (and that was always possible, anyway).

It should also be emphasized here that no individual rec.radio.amateur.* newsgroup is being singled out. Rather, a consensus of the readership concerning ALL rec.radio.amateur.* newsgroups is being sought.

Q: How long ago were each of the rec.radio.amateur.* newsgroups created?

1972 (or possibly earlier, this date is when UCSD joined the ARPANet):

Info-Hams (original ARPANet mailing list at Simtel-20, continues today
at UCSD as a gateway of rec.radio.amateur.misc)

1979:

Creation of Usenet News at Duke and UNC

early 1980's:

fa.info-hams (fa = "From ARPANet") *
net.ham-radio (pre-Kent Paul Dolan "Great Renaming") *

mid 1980's-1991:

rec.ham-radio *
rec.ham-radio.packet *
rec.ham-radio.swap *

1991 Reorganization:

rec.radio.amateur.misc
rec.radio.amateur.packet *
rec.radio.amateur.policy
rec.radio.cb
rec.radio.swap

1992/3 Addition:

rec.radio.info

1993 Reorganization:

rec.radio.amateur.antenna
rec.radio.amateur.digital.misc
rec.radio.amateur.equipment
rec.radio.amateur.homebrew
rec.radio.amateur.misc
rec.radio.amateur.policy
rec.radio.amateur.space

1996 Additions:

rec.radio.amateur.dx
rec.radio.amateur.boatanchors

* = obsolete

Current newsgroups covered by this proposed opinion poll, and the years
in which they were created:

rec.radio.amateur.antenna (1993)
rec.radio.amateur.boatanchors (1996)
rec.radio.amateur.digital.misc (1993)
rec.radio.amateur.dx (1996)
rec.radio.amateur.equipment (1993)
rec.radio.amateur.homebrew (1993)
rec.radio.amateur.misc (1991)

rec.radio.amateur.policy (1991)
rec.radio.amateur.space (1993)
rec.radio.info (1992/3)
rec.radio.swap (1991)

Q: Why are the non-rec.radio.amateur.* newsgroups rec.radio.info and rec.radio.swap included in this proposed opinion poll?

Though one level up in the rec.* hierarchy, these newsgroups are principally used by readers of rec.radio.amateur.*, and their fates would substantially be decided by any significant reorganization of the rec.radio.amateur.* newsgroups. Though created by a rec.radio.amateur.* reorganization, rec.radio.cb is not included in this proposed opinion poll.

This announcement has been cross-posted to all rec.radio.* newsgroups (except for rec.radio.broadcasting and rec.radio.info, which are moderated). In addition, the following individuals were consulted prior to this announcement (note that consultation does not necessarily imply endorsement):

Richard Eckman, KO4MR, Proponent of rec.radio.amateur.dx
Brian Kantor, WB6CYT, Administrator of Info-Hams/Ham-* mailing list gateways of rec.radio.amateur.* newsgroups at UCSD
Ian Kluft, KO6YQ, Proponent of 1993 rec.radio.amateur.* reorganization, former rec.radio.amateur.* FAQ Maintainer
Jay Maynard, K5ZC, Proponent of 1991 rec.radio.amateur.* reorganization
Brian Short, K7ON, Moderator of rec.radio.info
Rick Stealey, K2XT, Proponent of rec.radio.amateur.boatanchors

Q: Where can I obtain a copy of the original newsgroup charters?

ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.info
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur-reorg
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.dx
ftp://ftp.uu.net/usenet/news.announce.newgroups/rec/rec.radio.amateur.boatanchors

Q: Where can I find out more information about the Usenet RFD/CFV process?

ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Create_a_New_Usenet_Newsgroup
ftp://rtfm.mit.edu/pub/usenet/news.announce.newgroups/How_to_Format_and_Submit_a_New_Group_Proposal
ftp://rtfm.mit.edu/pub/usenet/news.groups/Guidelines_on_Usenet_Newsgroup_Names

Q: I don't want any of the newsgroups to change. What should I do?

Express your opinions on news.groups (the default followup newsgroup for this message) and vote "YES" for all of the existing rec.radio.amateur.* newsgroups when the proposed opinion poll occurs (in 30 days time).

Q: I want to go back to one single newsgroup for amateur radio on Usenet, like we had back in the 1980's. What should I do?

Express your opinions on news.groups, and vote "NO" for all (or all but one) of the newsgroups when the proposed opinion poll occurs.

Q: I support some of the newsgroups for amateur radio, but not others. What should I do?

Express your opinions on news.groups, vote "YES" for any newsgroups that you wish to remain unchanged, and vote "NO" for any newsgroup you wish to have reconsidered in a future RFD/CFV when the proposed opinion poll occurs.

Q: I support the existence of a newsgroup, but disagree with its charter. How should I vote?

Since the proposed opinion poll is for both the existence of given newsgroups AND their current charters, you should express your opinions on news.groups and vote "NO" for that newsgroup when the proposed opinion poll occurs. Again, this is a non-binding opinion poll simply to determine if current newsgroups should be considered for modification or deletion, not a vote to actually modify or delete these newsgroups.

Q: I would like new newsgroups to be created, what should I do?

Creation of new newsgroups is not being considered by this proposed opinion poll. A future RFD/CFV would have to be initiated to do this. You are, of course, welcome to express your opinions concerning new newsgroups on news.groups.

Q: I have no opinion, what should I do?

You may wish to read the following 30 days of public discussion on news.groups about this proposed opinion poll to develop your own opinions. Discussing your resulting opinions on news.groups may help further develop your opinions, or those of others.

If, after reading and participating in the public discussion, you still remain undecided, you may choose to abstain from the proposed opinion poll. You may do so informally by not participating in it at all, or formally by explicitly voting "ABSTAIN" for all of the newsgroups when the proposed opinion poll occurs.

Watch for an announcement of the STRAW POLL (CFV) in about 30 days. Questions to rra-wg@theporch.com.

Well, of course the filter has an impulse response. Every filter
does. But FIR filters don't "ring like a bell" the way analog filters
made with high Q resonators do. They are as close to artifact
free as you can get and still have a filter of a given response.

>seems to be reasonable.

Ah, there's the rub. The anti-alias filtering in the A/D is all of the selectivity we have in front of the A/D. This is the revelation which I rediscovered in my notes. The *combined* signal power of all signals in the A/D's anti-aliasing filter bandpass has to be handled by the A/D without overflow. A 20 kHz chunk of a HF band can have a *lot* of signal energy present. If we were to bandlimit that to 500 Hz with a filter in front of the A/D, we have mooted the use of DSP to get receiver selectivity.

So the dynamic range isn't nearly as good as it first may appear. We have to deal with the algebraic sum of all the signals in the anti-aliasing passband. That doesn't correlate well with the dynamic range figures we see with analog receivers measured through their much narrower filtering.

What this does tell us is that we should be using sharper anti-aliasing filtering, set to the largest passband a HF signal would assume. That'd

be an AM signal. So we need our filtering in front of the A/D to be 6 kHz. But we need *two* of those filters, one for I and one for Q, and they have to *match* precisely. Bummer. We're nearly back to an analog R2 with audio DSP.

As a point of information, my EZ kit lite uses 16 bit A/D, so it has a digital dynamic range of only 90 db. I find that I have to use the manual attenuator fairly often to keep it from overflowing. And when I do that, the desired weak signal often gets pushed into the noise floor.

Some analog rigs do too. But both of you have hit upon the critical factor.
In my receiver, all of the selectivity in front of the A/D is provided by the
anti-aliasing filtering in the A/D chip (there's a manual preselector in
front of the mixers, but the anti-aliasing filter is narrower). That means
that the A/D must be able to handle the algebraic sum of all signals in a
20 kHz bandwidth. Now the 64 dollar question, what sort of dynamic range
do we need to handle the algebraic sum of 20 kHz of the typical HF band?
Lets assume typical weekend 20m, and then lets assume Dx pileup. Also
lets look at nightime 40m and daytime 30m (where I'm actually operating).

That's not something I've seen covered anywhere. But it is critical to
determining how many bits of dynamic range we need in an A/D system.
I'd like to hear some educated guesses.

I'm looking for a Mallory computer grade electrolytic cap with the
following specs:

160 mF, 450VDC, 1 3/4" diameter, 2 3/4" long with screw terminals.

I need an exact replacement to both fit the physical space and
electrically match the others in a series string.

Please email n7ws@azstarnet.com

Thanks, Wes N7WS

4404. HBR Receiver Q-Multiplier "Gooser"

Source record: 83473

Hello Chris,

Another post recommended the TS-830S, which is a fine set. Also consider the following:

Kenwood TS-520S, TS-530S

Yaesu FT-101

TenTec Omni (any model), Corsair, Corsair 2

A search on Deja News will give you an idea of asking prices.

If you are interested in CW, there are some important features to look for in a rig:

1) Sharp IF crystal filter (400 or 500 Hz is fine, 250 Hz is good to have once you have a 400 or 500 Hz filter). Don't be mislead by claims about "IF shift" "bandpass tuning" or add-on audio filters - get a good sharp IF crystal filter first!

2) Defeatable AGC - Look for a switch to turn off the AGC. Under QRM conditions, often you can get the best copy by turning the AGC off, turning the AF (audio) gain up, and using the RF gain as the volume control.

3) RIT - Permits tuning the received frequency plus or minus a few kHz without moving the transmitted frequency at all. Needed if the other guy isn't quite on your frequency.

Good Luck!

73 de Jim, N2EY

Getting good duty cycle balance from simple dividers is indeed difficult. I haven't been able to do it successfully. (A walking ring counter can give good duty cycle balance, but requires higher frequency drive.) The follow-me PLL has worked Ok for me, but the use of a variable phase shifter offers a similar benefit. The upside is that it doesn't have to acquire frequency lock, the downside is that amplitude gain leveling is more of a problem. The follow-me PLL does that automatically.

Does anyone know any thing about a Motorola commercial radio system? This is a unit that was in use at a trucking company. It is in a 6ft cabinet. It has a receiver, transmitter, RF amp, antenna tuner, 3 meters, 6 band selections (no frequency selection) exciter. and various other switches gadgets bells and whistles. My question is, HF,VHF,orUHF? Can this be modified for one or the other? Can I use the amp for my rig (Icom736,6m-160m) I think that it is a VHF (not sure) if it is could this be modified for 6m and 2m ? The back panel is locked. Any help or comments would be welcomed.

Right. Those host mode programs just make up for some of the deficiencies
of the normal TNC interface, designed to work with dumb terminals. I'm not
talking about them. I'm talking about programs which do *everything* in the
PC, with or without external hardware assist.

> Another small observation or semantic nit-pick, if I may: The term

>no "terminal nodes" in RTTY, AMTOR, PACTOR, etc. I agree: the term TNC
>for HF data controllers should pass into oblivion (along with HF AX.25
>packet itself).

Heh, heh. Yeah, you're right about HF AX25 packet using Bell 103 tones.
It doesn't get much worse than that. But there can be terminal nodes in
any system which includes a *terminal*, or its functional equivalent, a PC
running *terminal* emulator software. (That *is* what TNC means. It
was coined when terminals were the universal user interface.)

I think you're really thinking about the PAD function. Packet TNCs contain
a packet assembler/disassembler. Other digital methods may or may not
packetize their bits. The TOR modes do. Clover does. RTTY doesn't.

But protocols belong in the host, not in an external box. The bits' journey
isn't complete until they are inside the computer. An external box requires
the bits to traverse what is often the most error prone part of their journey
unprotected by a CRC, ARQ, or any other protective protocol. The RS232

link is often the most serious problem area, especially with faster systems,
like the GRAPES 56 kb modem.

>"sound" card (or any PC for that matter), but (as usual) that may not be
>what is most marketable as a commercial product (so, again as usual, I
>will probably have to homebrew it!).

Well it is about as good as he claims it is. It beats all but the best dedicated
DSP boxes and boards for the modes it supports. Since it uses what has
become the standard equipment sound card in the PC, it is a no-hardware
solution for most people. PCs are the most common display device today.
There are more of them than terminals, in fact terminals are becoming
something of a collector's item. A PC is often cheaper, and often more
available to the dumpster diver, than a terminal. That will become more
so as time passes. It makes no sense to have it idling processor cycles
emulating a dumb terminal to a 8 bit micro when it could easily handle
everything itself.

That's very clear with single tasking machines. It isn't quite so clear
with multitasking machines. On the one hand, it is easy to implement
a protocol driver in a multitasking machine, but on the other hand,
off loading that mundane task to an 8 bit micro can allow the host to
do more productive things with its cycles. On the whole, however,
I think the benefit of bringing the protocol into the host outweighs
the other factors.

For Sale:
Quality NOS tubes, radios, test equipment and a wide variety of radio related publications. A new selection of misc. radio parts and many new publications have been added to this list. My schematic service is the best price around at just $3 delivered for schematics and tuning info on popular radios and TV's. If I don't have it, I'll try to help you find it! Hundreds of happy customers have used my service. Send to Rog42@aol.com for an E-mail copy of my latest offerings - list #326.

Actually, a "high Q" FIR rings just like a "high-Q" IIR does, except
the duration of the FIR response is limited by the length of the filter,
where the duration of an IIR response is limited by the resolution of
the arithmetic and is usually much longer.

One way to get coefficients for an FIR is to select the desired
frequency-domain response and perform an inverse-FFT to get the
time-domain response. So, select the narrowest response an FFT
can offer - make one bucket have a unit amplitude and all the
others zero (except the imaginary response, if present). The
inverse-FFT will yield a sine-wave limited in length only the
length of the coefficients.

> The follow-me PLL does that automatically.

Well, the 1:1 PLL only provides amplitude balance if the VCOs have
matched characteristics, it isn't anything inherent in the PLL. If
you build your VCOs using FETs, beware of fairly broad tolerance
from one FET to the next. In any case, you ought to make sure you
know what is providing amplitude stabilization and how reliable it
is.

The size is the difficult part. However, if you are willing to accept direct conversion, you can save on the xtal filter and several transistor RF stages. Unless you're clever with freq synthesisers, it may be hard to make a stable free-running VFO for 28 Mhz. Alternatives include making a good VXO (see my home page) to give a 50 - 300kHz tuning range or using a NE602 to downconvert to a miniature 80m receiver (DC or superhet).

You might even buy a 80m rx, and build a converter into it. A NE602 and 25 MHz xtal should be OK - alter the 80m rx tuning range to 3.2-3.6 MHz for the beacons $ SSB activity.

Of course, if you want something bigger a converted CB would be the logical choice.

What you really want is gain feeder, or cavoflex!
Fantastic stuff, just gain! no loss!
It was introduced onto the Amateur market in April last year.

While this makes sense as a dithering effect in presence of
uncorrelated random noise, what will the effect be if we have a
correlated distortion component in every sample ?

Agreed.

>A 20 kHz chunk
>of a HF band can have a *lot* of signal energy present.

Forgetting the pathological case with multiple transmitters on a
single site, how much signal energy is really present ?

I have seen figures that a single band antenna would deliver about 0
dBm and some wide band logperiodics would deliver +10 dBm over a large
part of the HF range.

A 20 dB ADC (120 bit dynamic range) set for a FSD at 0 dBm would have
the LSB at -120 dBm. Comparing this to a 300 K noise source (-174

dBm/Hz) in a 20 kHz bandwidth producing -131 dBm in the ADC passband. While the HF background noise is much stronger than the 300 K noise source, a 120 dB dynamic range should be nearly sufficient.

However, the ADC works with voltage levels and not power levels and the power coming down from the antenna is not sinusoidal (unknown peak to average ratio) so the situation is more complicated.

Has anybody actually measured the peak to peak _voltage_ developed across a 50 ohm dummy load when connected to a typical amateur antenna? While in theory, this peak voltage could be infinity (if the phases for all sources would match even once), but in practice the full scale range would have to set in such a way that the ADC rarely overflows (a few times a second at the most). An analog oscilloscope should be sufficient for his test.

While this test would measure the whole antenna bandwidth (which in most cases would be larger than the anti-alias filter bandwidth), this test would give some indications what to expect after the anti-alias filter.

Hi
I rec'd some comments via telephone/email about this very low-cost type mixer/modulator. S53MV has applied similar ideas in his famous 23cm very high speed packet link system.

I have shown a very low cost DC receiver for 40, 30, 20m using the RA3AAE mixer, with a cascode RF amplifier it was easy to read a 0.1micro volt CW signal on 40m. The circuit diagram is shown in Technical topics (G3VA) Radcom april 1995 pp50-51. Application of matching 3.5-3.6MHz VFO using Murata 3.58MHz ceramic resonator is shown in Radcom febr. 96 pp.75. Some obvious printing mistakes are in all text and circuit diagrams, in the latter text says that RF output is 9.9V RMS, the correct is 0.9V. The first technical note on application of ceramic resonator in simple 80m QRP transmitter also has some bad fault - the wiring of CD4001 is wrong, but knowing how this IC is connected, the connections to pin 1-2-3 and 7-8 makes the correct connection very obvious.

I also had a note for the simple vfo using ceramic resonnators on different frequencies, see technical topics, may 1994, pp54-55.
Only a BC238/2N3904 transistor is shown applied in this circuit.

.....Jan-Martin

A badly designed analog filter may do this but from my experience, a N pole Butterworth or Chebyshev built in either passive LC or active styles and using modern filter design methods, has the impulse response predicted by the mathematics of the filter. I can't see why this would be different for a digital filter having identical passband characteristics.

Can't wait to follow this one.

There are almost as many theroy's as there are amateurs.
The importance of RF ground should not be understated, but
it's relative importance is partially determined by what
type of antenna you are using. Verticals, particularly of
the quarter wave variety, use the rf ground system as a
phantom antenna. Their efficiency is directly proportional
to the efficiency of the ground system. Much heated and
varied discussion has taken place over the years. Do some
reading.

At a minimum, INHO, you should atttach at least one wire,
1/4 wave long at your lowest planed operating frequency, to
your ground rod. Run this wire in as straight a line as
possible. More wires are nicer.

I'm curious how the line was terminated when you made that
measurement?

In any case.. there was an anecdote in the report of the results of a
DX contest back in the late 1970s. Someone in W2-land claimed to have
lit three #47 pilot lamps in parallel across the coax of his 3-el 40m
Yagi. If true, I'm sure broadcast stations (not amateurs) were
responsible, but still your 40m receiver will have to handle that!

OH3LWR commented about total power to an amateur antenna:

I heard Peter Chadwick speak at Dayton some years ago and he mentioned putting a power meter across a (40M?) antenna pointed at greater Europe. Similar info may have been in RadCom about 15 years ago.

In The Radio and Electronic Engineer, Vol 52, No. 7, July 1982 there is a graph from Sosin in the Marconi Rev., 39, no. 20, 1st Qurarter 1976 (old and things certainly havent gotten better)

Receiver EMF to 50 Ohms (millivolts) #Signals in Freq Block

Freq MHz 4 6 8 12 14 ....
100mv 3 5 4 4 4 3 2 1 0
10mv 4 6 6 5 5 5 3 2 2 2
1mv 14 20 20 20 20 18 14 8 8 4 4 2
.more

"The selectivity should be such as to allow reception of signals at or near noise level, while all interfering signals of up to 100 mV should be attenuated to at least 3 dB below the noise........Thus for signals which lie outside the passband the maximum attenuation needed with a 300 Hz bandwidth is 107 dB to 188 dB from 1.6 to 30 MHz and with a 3 KHz bandwidth it is 97 dB to 108 dB from 1.6 to 30 MHz....The worst case is at 20 MHz"

"Very large signals (greater than 1 volt) are only encountered by receivers which are co-located with transmitters"

Not quite an answer to the question you asked, but someone out there has already hung a spectrum analyzer or power meter to the antenna and will reply.

: Mostly the whole continental US. Some of the mid-west is missing.
: Check the DGPS map page at:

: http://www.csi-dgps.com/

Looking at the US map on this web site I would say the midwest is covered pretty well but the west (with the exception of the coast and several hundred miles inland, mostly CA, WA and OR) the far west is not covered. Colorado, which is what I care about has NO coverage.

I guess people have different impression of what comprises the mid-west!

Wolfgang,

The SBX-2 looks good for that price, but after being a ham for 20 years I can tell you that there are those people who will always build electronics from scratch. BTW, all of my projects have had cost over-runs. <g>

I have removed the white Eagle DGPS labels from my Eagle, and painted it Army (olive drab) color. The eight "D" cell battery tube is now attached to my OD color pack frame, and seems to be the best way to use the thing portable. Here in the San Francisco area all I need is a 2' wire antenna.

For a suggestion, the homebrew DGPD could be wired on a long narrow board and installed inside the Battery PVC tube with the active antenna PVC tube.

The DGPS transmitters only have so much range. Especially when
driving in a car at ~65mph you'll eventually drive out of range. On a
drive up the coast from the Bay Area in CA to Washington State I ended
up using 6 or 7 different differential xmitters.

To retune you have to get out your handy dandy DGPS chart (from either
the USCG or the aforementioned site) and punch in the new RF frequency
and baud rate.

Think about this in terms of the laws of thermodynamics:

First law: You can't win
Second law: You can't break even
Third law: You always lose

This is just as true of coax as it is of any other physical system

Greetings. I am trying to find data sheets on the Mitsubishi RF PA "block" modules. I believe that Mitsubishi Semiconductor make one which covers the 6m amateur band (50-54MHz) but I have been unable to locate any information on any web sites I've looked at so far. Searching Alta Vista has produced no joy.

I need this info to complete the conversion of a 70MHz commercial radio (Kyodo/Sawtron KG107) to 6m. I have the RX working very well but it has a Mullard/Philips BGY32 module in the PA which only covers 60-74MHz.

Any information would be greatly appreciated. If someone can point me to an online data source that would be great - otherwise a hard copy by snail mail (or even a readable scanned copy via email) would be of great assistance.

Thanks in advance,

Rodney Baker VK5ZTV

Someone, somewhere is flogging magnetic doodads for water pipes that use pulsed fields, operated by a little mains power supply. The RFI output from some of these things has to be heard to be believed. They too may not do anything real to the water, but their effect on amateur radio is unfortunately genuine...

Hmm, my fault. I did not make that clear enough. An anti aliasing filter
like those used for audio applications is not enough, that's right. But
if we assume e.g. a 5..15kHz (NBFM) filter (passive LC as proposed by
KK7B), the sum of all signals entering the A/D is much smaller than
without such a filter.

Are there any graphs or tables showing the energy vs. frequency? The
only information I have shows the noise floor due to natural/man made
noise.
What DR can be handlded by a *real* (tm) high performance analog
receiver (e.g. a Rohde & Schwarz or a Watkins Johnson)?

If You can manage to calibrate it on the fly sa mentioned in an other
post, a perfect match does not seem to be vital for performance (this
does not mean that 5% tolerance will be sufficient, but 1% might be
enough to be corrected with software calibration)

> As a point of information, my EZ kit lite uses 16 bit A/D, so it has a
> digital dynamic range of only 90 db. I find that I have to use the manual
> attenuator fairly often to keep it from overflowing. And when I do that, > the desired weak signal often gets pushed into the noise floor.

The Codec used on the EZ kit lite is sufficient for PC audio, but definitely not for high performance audio applications. If You read the datasheet for the CS5396, You will see the difference. The CS5396 is ways more sophisticated (and expensive).

Some time ago, the German magazine ELRAD has published a test of this converter. The first wondered, if this converter would be just a 'gold plated' 20bit converter or if it really has a 24bit resolution. The test proved just that. DR was indeed over 120dB. (If there is interest I can dig out this issue and send You a copy (it is in German, but the graphs speak for themselves)).

This is by far the most interesting thread since quite a long time. I really hope it will end in a experimental receiver using this technique. I am working on a QRP tranceiver at the moment, but in late summer I might take up this idea and buy some stuff needed for such a project (DSP56002EVM and CS5396EVM). Luckily we have audio test equipment here at ascom, so I can make extensive tests with the A/D board.

Regards and best 73

<snip>

Matjas Vidmar S53MV used this mixer as PSK modulator for his 23cm and
13cm 1.2Mbit/s packet radios.

He writes this:

| A harmonic mixer with antiparallel diodes is used as the PSK modulator,
| since this circuit provides a reasonable unwanted carrier suppression (25dB)
| without any special tuning and without access to expensive test equipment
| (spectrum analyzer).
| The harmonic mixer uses a quad schottky diode BAT14-099R, since four diodes
| provide a higher output signal level than just two antiparallel diodes.

The urls to his constructions are:

http://www.hamradio.si/psk23cm.html

The only data I have found in the DS are THD+Noise, which is typically
-105dB with a -1dB signal and -97dB with a -20dB signal.

<< dithering with noise >>
> While this makes sense as a dithering effect in presence of

> correlated distortion component in every sample ?

Isn't there enough uncorrelated noise in a 20kHz bandwidth to enhance DR
using only 500Hz for the final BW?

> A 20 dB ADC (120 bit dynamic range) set for a FSD at 0 dBm would have
> the LSB at -120 dBm. Comparing this to a 300 K noise source (-174
> dBm/Hz) in a 20 kHz bandwidth producing -131 dBm in the ADC passband.
> While the HF background noise is much stronger than the 300 K noise
> source, a 120 dB dynamic range should be nearly sufficient.

It seems that *no* AGC in front of the ADC as I suggested once is not
sufficient. How about using an AD604 or AD605 (both are two channel AGC
amps with very accurate AGC) Their AGC range is about 42dB, suffiecient
for front end AGC.

> However, the ADC works with voltage levels and not power levels and
> the power coming down from the antenna is not sinusoidal (unknown peak
> to average ratio) so the situation is more complicated.

If You add some headroom, I think a sinusoidal estimation will certainly
be sufficient.

Kind regards and best 73

Source record: 83418

I do not believe it! I have this power station (20 A at 13.5 v) which weighs a ton, maybe two, must be accurate, and I have to sell because I want the room. I live in a Council dogbox and have recently inherited a packet of cigarette papers. You will understand the problem.

But who is going to give three figures for a hunk of circuitry without no specs? So I searches - and I searches - and I searches. All to no avail. It is going to go in my coffin with me for sure. They'll need four Tysons...

This morn at dawn (that rhymes - we hams aren't just twiddling fingers), I am searching for a 1994 Radcom to read to a mate above the rattle of machineguns in Lower Slobovia or somesuch Balkan dogsdinner. Above my head, high on top of the wardrobe I spy a likely yellowing dustspeckled bundle (you've been there, have you?) and tug.

I do not believe it! The only reason I'm not pinned to the floor by a wardrobe is it's nailed to the wall. Ten years Radcoms, however, thudded on my aged pate.

Swearing in Spanish, Polish and Dutch, handy skills I picked up on CW when I was a lad, I began to dust the precious journals off. And there - you've guessed, haven't you? I can see it in your emails. Yes, I have the specs of the power station thanks to Sir Isaac Newton's discovery of gravity.

For Sale: Kingsmill NS 1520 power supply. this techno-gem uses linear regulating technology to produce low ripple, high stability power. Cost ï¿½300 new. I had to send my old lady - but that's another story.

Offers over ï¿½100. Post? You don't have enough money to pay the postage on this White Dwarf. Buyer collects from Cambridge.

Frankly, it is a lab instrument. Far too good for some toilworn ham to gaze at wonderingly, invite his mates to worship before, finally use as a doorstop. But for one of you crisp upcoming technocrats with a shack Cape Canaveral uses as an annexe, one who has come across a Kingsmill it might have some use.

Puuh, sounds great. Ulrich Rohde has published parts of such a filter
used in a Rohde & Schwarz receiver in QST.

Have You published this filter or intend to do so? Would be a nice
companion for a quadrature DMOS mixer.

> 2. Hybrid PLL/DDS synthesizers are now very cost effective. Its a > simple matter to mix a VHF synthesizer down to 10-41mhz for a high > side LO and 9mhz IF.

Or to DC. Again, Rohde has published some very intersting stuff about
that. (Using a 10.7MHz ceramic filter between DDS and PLL to get rid of
wideband DDS noise).

Best Regards,

Robert

I have run across a Motorola Radio system that I need help identifying, This system belonged to a trucking company. It provide communications to it's trucks locally. It is in a 6' metal cabinet. 2 panel doors, front and back.(the back is locked w/no key) There is no model# in the front panel. Starting from the bottom. Power supply w/ main power switch, and a high voltage switch, and 4 fuses, next up, receiver, with 2 receiver switch positions w/+&-on each, and a band selection, 1,2,3, & 4,5,6, next, up, exciter, next, transmitter, grid plate selection and 2 selectors for the 8560-a finals (that are driven by 6883-b tubes) it has a PA indicator mic input, antenna Coupler, impedance matcher, and 3 meters on the top, mili amp, voltage & amp meters, How do I determine if it's VHF UHF of FM where would the model # be located ? (inside the locked back panel)? Could this be modified for amateur use without taking the whole system apart? I would like to keep the unit together.
Any comment or suggestions would be welcome. E mail MCANNON785@AOL.COM

It may be of interest that the FAA is installing a different sort of system.
Called WAAS (Wide Area Augmentation System), it will use two GEO
satellites to broadcast correction signals uplinked from 24 terrestrial
locations in the US. The kicker is that it will broadcast CDMA on the
same frequencies as the regular GPS constellation. This means any
GPS receiver already has the hardware to receive it. New firmware will
be required to utilize it, however.

The FAA is claiming 5 meter 2D accuracy anywhere in the US for
this system. The first GEO launch is set for this fall. They're also
installing LAAS (Local Area Augmentation System) at major airports.
This too operates CDMA on the same GPS frequencies, and will give
a claimed 3D resolution suitable for precision approaches and landings.
First units are also scheduled to be operational this fall.

Will this spell the end of LW DGPS? Maybe.

Robert M. Ganter (robert.ganter@ascom.ch) wrote:

: It seems that *no* AGC in front of the ADC as I suggested once is not
: sufficient. How about using an AD604 or AD605 (both are two channel AGC
: amps with very accurate AGC) Their AGC range is about 42dB, suffiecient
: for front end AGC.

..

I haven't had time to read all the articles in this thread, so please excuse me if this has all be hashed and rehashed. But I have a couple observations that I haven't seen mentioned:

1. Delta-sigma ADCs have very wide bandwidths. They must deal with the full bandwidth that you feed them. For example, if you have one sampling at 48k/second, it typically will have a very sharp decimation filter which cuts the output off starting at about 20kHz. But...the analog (modulator) part of the ADC must deal with whatever you toss at it, and in fact will alias things back down from RF, if you put stuff in at the modulator sampling frequency, typically 64 or 128 times the output sample rate. In fact, intermod between a signal at 100kHz and 101kHz will, indeed, land on 1kHz. Fortunately, the intermod performance of ones I've tested seems pretty good. But you are well advised to put a decent antialias filter in front of the ADC if your basic signal source goes beyond the ADC output filter cutoff frequency. Phase matching those filters, as Gary pointed out, is important if you want to do a phasing system.

2. However, consider a 24-bit ADC. Let's assume we can put a "perfect" amplifier in front of it, so its input range is matched well to the mixer output voltage range. But...the typical little DBM from MiniCircuits or the like might have an output compression point of +5dBm or so...if you get much above this level, things will be rather horribly distorted. In my mind, that puts a limit on the range of signals that the ADC must handle. And all the delta-sigma ADCs I've tested have _distortion_ products which drop with drop in input signal. The broadband noise floor is something of a red herring, because the filtering you will do in the DSP will drop that noise floor considerably. OK, if the mixer has an input 3rd order intercept of +30dBm, then if you hit it with an unwanted signal that drives it to just below its compression point, what level of distortion products will you have from the mixer? Will that 24-bit ADC be any worse? My notes suggest that the ADC won't be the limiting factor. And the mixer must handle a bandwidth that doesn't have the same limit that the antialias filter provides for the ADC. With lower levels of unwanted signals, you might possibly want a bit more gain going into the ADC...but with 24 bits, you shouldn't need much.

Summary question for consideration: do 24-bit delta-sigma ADCs with reasonable pre-antialias filtering take a back seat to diode DBMs in dynamic range? DBMs may not clip quite as "hard" as ADCs, but they do clip...And DBMs do have 1/f noise at low output frequencies.

By the way, we build equipment here that makes use of delta-sigma ADCs with antialias filters and DSPs...for "dynamic signal analysis." I've tested phase match between channels. These channels have very "grunt" (no tuning; 5% tolerance inductors) five-pole Butterworth antialias filtering with a 400kHz cutoff frequency. I see phase matching between channels typically in the sub-millidegree range at 20kHz. If I was interested in an AM voice bandwidth signal (+/-3kHz...in an I/Q system, only need 3kHz bandwidth), the antialias filter could be scaled down to about 50kHz and get the same match.

: Does anyone know what I am talking about and if so, who manufactures it or
: sells it.

: Any help will be much appreciated.

It's probably not photoresist coated. It's probably the blue film you put thru a laser printer. You then transfer the pattern to what you want to etch with a hot press...you can use an iron. You must use a laser printer, as far as I know, because the heat-meltable plastic toner is an important part of the process. Inkjets wouldn't work.

There is dry-film photoresist, also. You heat-transfer that film to your metal, and expose, develop and etch as you say. I found a site on the web offering serious-hobby/small-commercial size equipment and supplies. Don't have the site bookmarked on this system...but can find it if you're unsuccessful. Search on "photoresist" and "photo etching".

Anyone know where I can get hobby quantities of photoresist? I used to use Shipley/Azoplate AZ111S, but Shipley no longer distributes it. The company that does sells it in 5-liter putup, at about $1000, which is a bit steep for me. I could go one liter, if enough of us wanted to share...

HI Chris OM,

I highly recommend an older transceiver for starters (also keepers).
My suggestion is the TS820 or TS820S. These rigs are simple, rugged,
easy to use, have built-in AC supply, are repairable, and also have FSK
capability (FSK was, inexplicably, deleted in the TS830S, TS430S,
TS440S). They work well for most all modes including RTTY and ARQ modes
such as Amtor and Pactor. I've been using mine most every day for 18
years now, exclusively CW and FSK, and I wouldn't part with it. Later,
when (if?) you ever want to sell it, it will be worth about what you
paid for it. $400 is a ballpark price today, and hasn't changed in the
last decade or so.
Good luck, keep it simple!
73,
Don W6JL

4467. Addition of CW to Converted SSB CB?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-27 00:00:00 UTC
From: scottd@goodnet.com
Message-ID: <3544e58f.5318922@news.goodnet.com>
Source record: 83434

OM's,

I've converted a Sears Roadtalker SSB CB ($2 thrift store bargain) to 10M. I recently read an article outlining a CB-to-6M conversion by Shawn Baris ZR1EV, in which he stated the following:

For CW enthusiasts , the addition of an 800Hz audio phase shift oscillator feeding into the mic input would produce excellent results. I had a TONO 5000E connected to my rig for CW contacts with JA stations and had many QSO's on CW with compliments recieved on the "tone".

I would be VERY interested in the addition of CW to this rig. Has anyone done so and could you provide suggestions? I really don't want to "hack" this rig to pieces but if it can be done realtively easily, I'll tackle it.

ps What's this TONO 5000E of which he writes?

Thanks.

Yes this is of great interest. I would like to find out more about this. Where can I get more information? JD

4475. CORRECTION: Send STRAW POLL Discussion to rec.radio.amateur.misc

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-27 00:00:00 UTC
From: pschleck@novia.net
Message-ID: <6i32liior1@newscene.newscene.com>
Source record: 83442
Cross-posted to:
rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.noncomm

Based on thoughtful feedback from Kathy Pascoe (kpascoe@ford.com) and Yves Belleveuille (yan@storm.ca) on news.groups, I've come to the conclusion that rec.radio.amateur.misc would be a better followup target for this straw poll discussion.

I sent the original copy (complete with exact headers) to several experts, including past newsgroup proponents and our volunteer UVV votetaker for review a week prior to posting, but unfortunately no one (including me) noticed that a followup to news.groups might generate controversy. As helpful as the standard FAQ documents on newsgroup creation were, they weren't (in my opinion, at least) sufficiently clear regarding the inadvisability of conducting informal meta-discussion on news.groups. It's also sometimes hard to figure out what's appropriate on what newsgroup by observing others. According to Kathy and Yves, news.groups is an appropriate target for discussion in response to a formal Usenet Request for Discussion (RFD), but informal pre-RFD discussion (including straw polls) should probably be conducted in an appropriate home newsgroup.

Since more than one person has offered this feedback, and in a thoughtful and convincing manner, I'm posting this correction, and asking that followup discussion on this straw poll (which should commence, as scheduled, in 30 days time) go to rec.radio.amateur.misc.

IIRC, the yellow one is the first IF, final IF is black, second IF (if present) is white. Don't quote me on that. :-) The tapped side of each is the collector (input) side.

You can tell if the cap is present by feeding a 455 kHz signal from a signal generator across the xfrmr with a couple K of resistance in series with the generator. Watch the voltage across the xfrmr on a scope and see if there's a dip around 455 kHz. If so, the cap is present. (Although I have never seen a miniature transistor-radio-style AM IF transformer that didn't have the cap built in).

It's Mini-Circuits Labs, but that is not a standard part number for any of their products. They have a series of mixers with model numbers RMS-nxxx, and some LRMS packages but nothing that starts out with a number.

When you anti-alias at a frequency very near your final DSP filter bandwidth what is the point of having the DSP in the first place? Besides, since you guys insist on direct down conversion whazzit this worry about DSP dynamic range and anti-aliasing filtering in front of the A/D? You still have appreciable opposite sideband signal getting in your way from your phasing receiver. This is why I like a well preselected upconversion rig with a decent filter at the first IF providing guaranteed antialiasing and image rejection. Then I look for a suitable position on the slope of the roofing filter for the nyquist frequency, double it, and sigh deeply when I cannot yet find the A/D I want. {^_-}

I never considered this mode of operation. It means you have to contend with
way
too many signals at very high levels meaning your practical IMD performance is

big time miserable.

> However, technology has been available for years which negate the need for
> the upconversion "performance buster." Specifically,

Negative - upconversion is good for one thing only, reducing spurious mixing
products. Since I see no particular point of benefit in generating a receiver
with
restricted band coverage and serious spurious problems if I try to receive
something
outside its optimal bands I opt for upconversion.

That works equally well with the front end of an upconversion receiver and adds
the benefits you get from moving out from under the nastiest mixer spurious.

> 2. Hybrid PLL/DDS synthesizers are now very cost effective. Its a simple

DDS synthesizers can function equally well as the oscillator for an upconversion
rig as for a down or muddled (up and down depending on band) conversion rig. I

am not yet convinced that a very high performance receiver for conventional ham
usage would want to use a DDS yet. Their spurious levels are annoyingly high
with today's technology. (Yeah, 10-15 years ago their spurious was impossibly
high so things are looking up. And yeah, I built my first one on a contract for
Qualcomm a couple decades ago.)

I'd check AES/HRO or Burghardt to see what they've got used. I can reccomend the IC730 which show up used from time to time. Solid
state, first radios to have WARC bands, which are nice. That's
really the problem with most of the old tube radios is they don't
have WARC bands, 30/17/12. I had an IC730 but sold it to my brother.
Put up a wire antenna. And go to Radio Shack and buy an HT for 2m.
That'll set you up pretty good. 10M really works nowadays too.

NOPE, LAAS will use a VHF uplink for differential corrections
operating in the 108.00 MHz to 117.95 MHz Airborne NAV band.
At least thats the current proposal. The SCAT 1(Special Catagory 1)
satellite landing systems are available and certified already.

I have an old (late seventies,early eighties) President
Grant CB (Aussie spec 18channel). I really want to put
this on 10m or maybe even 15.
How do I go about it, can anyone give me info on it
Thank you
73 de jimmi de vk2jem.

I like the idea of employing ceramic resonators for narrow band VCOs
The Q should be much higher than LC and the pulling mid way between LC
and Xtal.
I would also remark that they are easier to open up and could possibly
be altered in frequency by modifying a critical dimension. Someone could
also try changing the frequency by controlling temperature rather than
employing a varicap.

Chris my reccomendation is to shop the hamfests this summer and look for an old Heathkit you could find an oldCW transceiver for under $50, I can't remember the model number HW-16? I've seen several of them selling for around $30 or so, a basic CW transceiver that covers 3 or 4 bands. Find someone at the fest who can show you whats available.

Good luck ! We have openings in Muncie, only 90 miles away :)

Seriously, this is pretty difficult. 2 years ago, we took a room on a lark,
but we got the LAST room in a hotel
about 40 miles away. It's worth it though, I don't know where you're coming
from, but if you haven't done dayton
before, it's a blast, and you can't bring enough money :)

Re: amplifier diagrams

Tom,

You can use the Collins 30-S1 which uses a 4CX1000. It's pretty darn close
to the same tube for a circuit and operation. The tubes pretty much
interchange in operation except the extra capacity of the 4cx1500 I have
and use both in my Collins and homebrew gear.

Chris, one thing that's worth considering. I bought a Heathkit
as my first HF rig. It worked pretty well, and it broke down
from time to time. However, it came with the full set of manuals,
with nice troubleshooting charts, which was VERY handy. And it
was originally built as a kit, so components weren't jammed in
on top of each other, as with some modern gear--there was room
"under the hood" to work on it. Every time it broke, I'd get
out the manuals, pop the cover, and start troubleshooting. It
was always something I could fix, at least until I just got tired
of dealing with it, after about 5 years.

The result is that I learned something about radio electronics,
and got to know my own rig very well. That worked out very well
for me--and being an old Heathkit, I got the rig at a pretty good
price in the first place. Just one more datapoint to consider as
you look for a rig, Chris. Good luck, and 73!

Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.design

Basic arrangements of RA3AAE's mixers are shown in G3VA ART6 (RSGB 1978) pg 123-124, based on an article in Radio Dec 76. It also refers to 'IEEE Trans on Microwave Theory and techniques, Vol. MTT-23, No.8, August 75, pp667-673 which does not only provide detailed mathematical analysis of this interesting circuit configuration but also reports on experimental microwave mixers for 4 and 12GHz ....
the following features of this mixer are underlined:
1) Reduced conversion loss to other harmonic mixers by suppressing the fundamental mixing products
2) Lower noise figure thru suppression of local oscillator noise sidebands
3) Suppression of direct detection
4) inherent self protection against large peak inverse voltage burn-out.

A few months ago QST printed a note to the effect that a corrected version of the schematic for "The Cycle Master" (from the September, 1997, issue of Qst) could be downloaded from the ARRL site.

Out of curiousity, I did so. Nice schematic. Unfortunately, I did NOT keep the original article (I pass old QST's along to starving students as soon as new ones arrive), and I'm curious just what "The Cycle Master" is/was. VFO? Frequency counter?

I might even want to build it!

Yep, that's already obsolete. The LAAS system now being proposed
operates just like the WAAS system except the CDMA signals are
coming from a terrestrial transmitter at the airport. In other words,
the not yet fully implemented VHF DGPS correction signals are
already passe.

Hmmmmm. I'm not telling you that FIR filters HAVE an
impulse response, I'm telling you to actually generate the
coefficients and LOOK at them, instead of talking about
them. If you do this, you will see them oscillating in a
sin(x)/x manner. If an impulse response of this nature
doesn't describe "ringing" to you, then I don't know what
else to say...

>But FIR filters don't "ring like a bell" the way analog filters
>made with high Q resonators do. They are as close to artifact
>free as you can get and still have a filter of a given response.

To accurately model "a given response", an FIR filter will need
a sufficient number of taps. As has been pointed out to you by
at least 2 other posters, the longer the filter, the more ringing you
will get when you try to have sharp cutoff skirts. So this brings
up an interesting question - say we shorten the filter to a lesser
number of taps. Do you not consider the attending Gibbs
phenomenon to be an "artifact" of FIR filter design?

4513. Help: homebrew QRP amplifier

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-28 00:00:00 UTC
From: Bob <bob@NoJunkEmailForMe.nothing>
Message-ID: <01bd72e7$2d4ee940$LocalHost@default>
Source record: 83385

I am looking into building a ~75 Watt amplifier for my homebrew 4 Watt CW QRP rig using a single grid driven 6146 from 40 through 10 meters. What my question is: I would like to drive the grid of the 6146 with the secondary of a broadband toroid say using an FT50-43 with about a 1:4 ratio and swamping the grid with a resistor of around 500 Ohms to avoid using any tuned circuits on the input of this amplifier. Anyone ever try something like this? I've also considered using the 6146 in a grounded grid fashion but 4 Watts is probably not enough power to do the job in GG mode. The plate circuit will be the usual PI network. TNX.

I just received an order from Digi-Key and bought some paper fro PC Boards. Xerox artwork onto the paper, Iron to the blank copper clad, Soak in water and Etch. Looks simple. They also say you can copy text and designs onto the paper, spray a couple of coats of laquer to seal, then soak in water to remove. Voila - you have custom labels and case markings.

Works with Xerox copiers and Laser Printers.

Digi-Key (800) 344-4539. Call for a catalog. They also have TOKO filters, including a BP 300 to 3000 Hz, HP, LP, and Combo. and PIC's and Basic Stamps TOO.

Hey! Tell 'em I sent you, and they'll say "Who?"

Tom must not have check Tandy parts before opening his mouth!
I would have liked to pay $5 for the thing. It cost me $23 shipped
from national parts.
If anyone wishes to dispute the price call Tandy's National parts
line at 1-800-843-7422 and ask them the price for part number
MS1901101 (Manual Service catalog #190-1101.

Does anyone know of a source for Mitsumi adjustable coils?
I have tried most of the major electronics distributors and searched
the net with no luck!
If I wanted Toko coils I found a half dozen vendors that would ship
next day!
Murphy strikes again!

4522. Simple DC radio for DSP experiments

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-29 00:00:00 UTC
From: Leon Heller <leon@lfheller.demon.co.uk>
Message-ID: <BShoDCAGTxR1EwUy@lfheller.demon.co.uk>
Source record: 83305
Cross-posted to: rec.radio.amateur.homebrew,comp.dsp

I've developed a simple direct-conversion receiver based on Rick Campbell's designs, for experimenting with DSP filtering and demodulation. The diplexer is taken from the Mini R2 because of its simplicity and the easily available capacitors, and the audio pre-amp is the R2 version, with the emitter follower on the output. I've added an op-amp for additional audio gain. Just use one of the Rxs for a conventional DC radio feeding a DSP system for audio filtering (I'm using the ADI EZ-KIT Lite) or two of them with quadrature oscillator circuitry and an RF splitter for a phasing Rx.

Details are on:

http://www.lfheller.demon.co.uk/dc_rx.htm

My prototype was wired up "ugly" fashion on a scrap of PCB material. I've designed a PCB, and will be adding a PS file for the artwork to the web page, when I've made one and checked it out.

I'm using a DDS (AD9850) local oscillator controlled by my PC, with the Rx, on 40 m. The radio is working quite well, although some of the colossal signals we get here in the UK on 40 m in the evening are causing overload problems, even with a titchy shielded loop antenna. I'll eventually be moving everything up to 6 m, and adding a Tx.

Leon

For 10M, send an email to CBC International (info@cbcintl.com) and ask for a catalog. He charges 5 or 6 $US for a well-documented modification/tuneup report that always includes 10M info. I've never heard of a 15M conversion however, I do have an article on a 6M conversion.

4530. NRD 535 crystal filters wanted /to exchange

The way I read it, yes it will continuously search for a better beacon with the second receiver and switch to the best one at any moment. No GPS or computer intervention required.

4534. Iso-Loop Tuning Control?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-29 00:00:00 UTC
From: John Reynolds <john.c.reynolds@tek.com>
Message-ID: <3547C24E.CFE4FA4B@tek.com>
Source record: 83317

Has anyone done any hacking on the control box for an AEA Iso-loop? The Iso-loop seems to work ok, but tuning it is a bit tedious. The control box electronics consists of a 555 timer driving a stepper motor control IC. Seems like it would be pretty easy to replace the standard control box with a microcontroller to provide memory presets. This would let me store the tuner settings for my favorite frequencies and slew the stepper with a single key stroke. Has anybody already done this?

Thanks for any info,
John Reynolds N7IW

Hello Bob,

I haven't tried your idea, but it can be done. If you use a toroidal transformer (some folks would call it an "unun") with a 1:4 turns ratio, you'll get a 1:16 impedance ratio. This means you need a swamping resistor of 50 X 16 = 800 ohms. Four watts of power across 800 ohms is only 56 volts, which is probably not enough to drive a 6146 to full power in Class C, but will probably be OK in Class AB2.

You will have to provide fixed bias for the grid of the 6146 and a fairly "stiff" screen supply, so that the tube doesn't draw excessive plate current during key-up.

What will you be using for a power supply?

Good luck & email if you need more ideas or help.

Um, you can still get dry transfer lettering at various art supply stores, but computer generated artwork seems to be driving dry transfers pretty much out of business. 3-M used to sell something called "Image-n-transfer" that was a do-it-yourself dry transfer; don't know if they still make it or not. You need to expose it to your artwork and develop it before use. But I think most folk these days do computer generated artwork...things like reverse-printed on a transparency, and just trim the transparency to size and put it on the front of the panel. There are probably some other ways to solve the problem, too...I've done a LOT of photoengraving of anodized aluminum panels, and that works really well, though isn't easy to set up for. Screen printing is another possibility.

>someone at the fest who can show you whats available.

Thanks for reminding me, Tim - don't know how I forgot the wonderful HW-16.

The HW-16 is a fine starter CW rig. It runs up to 90 watts input on 80, 40, and 15 meters, CW only. Has a sharp filter (only 2 poles, though), no AGC (you don't need it), QSK (full breakin), and is very easy to tune up for a tube rig. (It's all tubes except for the power supply and a switching transistor). You need the matching HG-10 VFO to go with it. (Novices used to have to use crystals, so the rig doesn't have a transmitting VFO built in). This rig isn't really a "transceiver", rather, it's a transmitter and receiver in one box. It also has a fixed 50 ohm output impedance, so you need an antenna with a low SWR, or an external tuner. Add a speaker and a key, and you're all set.

The HW-16 cost $99.95 as a new kit in 1967, and its price reached $149.95 when it was discontinued about 8-9 years later. The matching HG-10B cost $34.95 originally, and its price reached $49.95 if I recall correctly. Used prices are all over the place, depending on condition and the seller's attitude. As another poster said, be SURE to get the manuals.

Good luck & 73,

Jim N2EY

Yeah, it looks like the entire mid-west is blanketed, and the plains
and mountain west pretty much got skipped. For anyone who might care,
"the midwest" is pretty much Ohio, Indiana, and Illinois. It was named
so in the 1830's, when the Mississippi River was "the frontier" and
Missouri and Arkansas "the west."

The big corridor not covered by DGPS beacons, mainly ID, MT, UT, WY,
CO, AZ, and NM, are pretty much known as "the mountain west" for what
should be obvious reasons. ;^)

Why not a USED FT290? Here in Aust they are normally $350-400 second-hand
(though I've seen them as low as $150). So that would work out to be
approx $US250.

They're good for driving transverters too - I can do 80-10m all mode on
an FT290 with two transverters.

4544. WTB: 2 VHF Rubber Duck Antennas

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-29 00:00:00 UTC
From: tje@usol.com
Message-ID: <3547f738.2916991@news.usol.com>

Hello. I am in need of 2 full size VHF rubber duck antennas for a couple of recently acquired HT's. One has a stubby duck (which works about as well as a dummy load) and the other has none at all. If you have a couple in good shape with standard BNC connectors please email me with your asking price. Thanks in advance.

Hi Martin,

MB3756: 8V switched RX/TX regulator.

In (11-16V) - pin2
GND - pin 4
ref decouple - pin 3
ptt (active low) - pin 5
+8V out (100mA) - pin 1
+8V RX out (100mA) - pin 6
+8V TX out (200mA) - pin 8

The part is obsolete.

4548. Re: What is "The Cycle Master" (QST, Sept. '97)?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-30 00:00:00 UTC
From: n2ey@aol.com
Message-ID: <1998043001195600.VAA13022@ladder01.news.aol.com>
Source record: 83321

Hello Myron,

The Cycle Master is a control unit for rigs that use a voltage controlled oscillator for a VFO. Many QRP rigs are built this way, so that tuning can be done with a simple potentiometer. The Cycle Master provides a precision tuning and drift control system similar to a PLL, but adaptable to almost any rig. It also gives digital frequency readout, RIT, memories, and some other neat features. It is meant to be used as an accessory to the rig.

Here in Scotland I usually see carrier powers greater than -10 dBm
from SW broadcast stations via my 100 foot dipole.

I've had a copy of Sosin's original paper since the 70's, and always
found that the most interesting section. I also used to have a Marconi
H2900 receiver which was the thing that Sosin designed in response to
his findings on spectral occupancy and signal strength. It was an early
prototype, bloody heavy, and milled out of solid!

Cheers

I was thinking about constructing a multiband adaptor for the TT Scout. Something that would accomodate all my 7 band modules (80-40-30-20-17-15-10) in a box, with a band selector switch. Quick and easy band switching that way. Anyone think/try this yet? Also, what about homebrew/modded modules for 6M, or a second/remote VFO?
I would think at least the module box would be quite do-able. Comments, suggestions, warning all gratefully accepted.

Will

From: "Christopher W. Buckley" <cwbuckle@mtu.edu>
Subject: WTB: Small Directional Antenna.. Suggesstions?
Newsgroups: rec.radio.amateur.antenna
Organization:
Summary:
Keywords:

I, being a new ham, an EE major, and out of $$, have decided that instead of buying a rotor, I'm
going to build a small one, which mounts on a tripod, and has azimuth and elevation rotors. I've
got all the junk I need for that, but now for the critical part- the antenna.

I'm looking to buy a small directional antenna. I was really considering the AO-27 antenna that
Arrow Antenna has, but they won't tell me any specifications on it, like bandwidth, gain, or
anything, so I am suspicious. Anyway, if someone has done a little testing with this thing and has
any comments that would be great. I'm hoping to use this for general portable work, though, not
just AO-27, so I'd hate to sink my $$ into an antenna which would be good for nothing else.

If you have any suggesstions for an antenna, or better yet, if you have one you'd like to sell me,
let me know! Currently my requirements are-

Light/Small:
I'm using a couple of stepper motors for the rotors, and I don't thing they'll handle much over 5 lbs. of antenna after I'm done with the mounting business.

Directional:
What would be the point of a rotor otherwise?

Dual Band:
I would like to be able to operate from 146-148 and 437-440 at least. Big plus would be 440-450 operation, though.

Duplexer:
I'm hoping to just plug this thing into my HT and go, without an external duplexer.
But this is only a matter of convenience. If you have an antenna/duplexer combo, I would be interested in the two together.

Other plus's woud include wider operating frequencies to cover the top part of 70cm and the lower
part of 2m, BNC connectors, and circular polarization.

Thanks,

Chris Buckley

One thing I don't like about my FT-50 is its so darn little. I figure if I solder some ni-cads together in a tall plastic case, attach an old battery pack bracket on the back so it will plug into the radio, I'll have a larger handful and more time between charges. What do you think?

>At least thats the current proposal. The SCAT 1(Special Catagory 1)
>satellite landing systems are available and certified already.

Further details. See FAA-E-2892A for system technical details, and
also read the March 1998 SatNav newsletter from the FAA which
reports that the first of these new systems, in Oakland, has been
activated for system testing. The FAA is formally abandoning plans
for transmission of DGPS signals in the VHF airnav band in favor of
this newer system which transmits everything CDMA on the GPS
L1 frequency. No separate receiver will be required to use the
augmentation, just new firmware in the GPS receiver.

>
>ps What's this TONO 5000E of which he writes?

It is a specialized computer which sends and receives CW and
RTTY using its own keyboard and screen.

But you already know how to make your SSB radio send CW.
Do as Shawn recomends and feed a low distortion audio
oscillator into the microphone input. Key that oscillator to
produce CW. It is AF CW, but the SSB rig converts it up to
RF and you can't tell the difference on the air from more
conventionally generated CW. Some of the new Japanese
transceivers use a similar method of CW generation.

4563. Re: MC1351P as AM synchr.det

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-30 00:00:00 UTC
From: la8ak@xnd.no
Message-ID: <3547c1e4.11902048@news.sol.no>
Source record: 83336

I just looked through the RSGB Technical topics scrapbook and found these notes.
SN76660N/TBA120(SO41P) as ssb/AM demodulator, CW MS audio upconverter with pcb pattern, also shown application of internal xtal oscillator (SM4LLP/LA8AK) Technical topics G3VA Radcom November 1985 pp.61
MC1351 SSB?/FM/AM demodulator and mixer (G4BLT) Technical topics G3VA Radcom June 1974 pp380
Many Dutch and German journals show several other applications (like p.s.d.) of the TBA120/SN76660N
I hope to move an old circuit of MC1351P from Tandberg Huldra 9 BC receiver to Siemens Rainbow receiver to improve it for shortwave BC reception. With 250mV AF I believe 20dB further audio gain is required to match an envelope detector.

Do you have anything specific?
Or do you want a general diatribe?

Anent the GD, you were probably told about the water tower in electronics
class, and its similarity to a capacitor. The water can be going into the H2O
tower at any rate, as long as it is SOMEWHERE near the outflow, and you
have a smooth outflow of even pressure.

It doesnt matter if the water runs in at a steady amount or in pulses, or
anywhere between. The output should be the same. HOWEVER,
and this applies to electronics as well, it is more efficient of the cost of
operational energy to pump into the tank for a while and shut off for a while.

Less wasted energy pumping.

In a power supply, the analog systems waste much more power (run
way hotter) than switching power supplies.

Hope that helps.

4565. FS: valves for amplifiers

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-04-30 00:00:00 UTC
From: arnoldg@sf.telia.no
Message-ID: <3548cf67.0@d2o204.telia.com>
Source record: 83338

I have various valves suitable for shortwave high power amplifiers
always in stock. EL 509/519, PL 509/519, 6DQ5, 811A, 813, 829B,6146,
and many of the very large valves like 4-65A, 4-125A, 4-250A and
4-400A.
Also HV transformers and chokes. Visit my homepage for more
information at http://www.vestdata.no/~arnoldg/valves.htm
or just e-mail me.

Best regards,

Arnold Goks&#65533;yr

Try the B&W home page at http://www.bwantennas.com/index.htm

Surplus Sales of Nebraska (1-800-244-4567) also carries B&W inductors.

If you have the KPC3 in terminal mode (hooked to your computer via
a serial cable) Just type:

INT KISS
(after changing the INT mode, you have to do a soft reset
for the new mode to take effect) Just type RESET

Tot Ziens!

Source record: 83342

Not all cordless phones are suitable for conversion, due to
the sourge of SMD components and Custom CHIPS.
There was a particular (recent)model of GE cordless phones that U could
get for $30 or so.
This model had all or most normal sized components
and had a (very) good range and clarity for this type
of cordless phone.

In fact it was MUCH better than SONY etc priced 2-3 times.

CONVERSION:- replace that Motorola Synthesizer chip meant for
cordless phone (145166 I think) with a better synth chip
which doesnt have the damn LOOKUP ROM inside it.
Then, program a PIC to control this thing, and do other
control functions. (replace the Custom Microcontroller
with this PIC) You should now be in the HAM band.

While you are at it, retune the DUPLEXOR etc.

In fact , this should make a pretty nice LOW cost
project, and is much easier than the cellular phone conversion.

Rick - ICOM used to sell a DC pack that ran off 12VDC. It just slipped on like the regular battery and you ran a 12v to a mini connected into the back of it. I used my in the car that way all the time to avoid depleted nicads. I think is was called a DC-1, but can't remember for sure. I still use it regularly.

DDS does *not* exacerbate the phase noise of its clock source. It'll be
cleaned up by at least 6 dB, in fact, due to the Nyquist limitation, and
6 more dB per octave below that.

If you use a good-quality crystal oscillator to drive the DDS, there
will (for all practical purposes) be no phase noise. Use a cheap
computer-grade TTL clock module, though, and you may be in for a rude
surprise. :-(Some of those things are very noisy.

The Nicad Lady, Periphex, E.H. Yost among others all sell replacement
fill ins for the BP-3. All advertise in QST, CQ, World Radio and/or 73.

As I recall, the 2AT had a voltage limit, so you couldn't just run it off
13.8 volts. If you have more than one broken battery pack, putting
in a standard 10 volt regulator feeding a pass transistor would work
to power the 2AT for long periods of time. Please note however that
although the 2AT was a reliable rig and is still functioning that the
heatsinking is minimal compared to even the 02AT.

Overheating on long TX periods is a real concern with the old IC-2 when used with voltages above 9-10V. The output transistor is heat-sinked to a thin metal frame which is thermally insulated by the case, so when it gets hot it tends to stay that way.

I'd risk 10V in the British climate, but wouldn't go above that. BTW, Zack's idea about using a low-dropout regulator is a good one.

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

>Johnny, KF4WWF1

Radio Snack, the Tandy company now sells a plug which fits into the power socket on the side. Some wire, that plug and and a 2 amp battery pack at let's say 10 volts would probably work better. You can also try the MAHA battery pack, which is 7.2 volts @1.8 amps if I remember correctly, the price is about $50. Also, if you have patience, Mouser sells a better power plug which won't fall out regularly. It's similar to the one that comes on the power pack with the FT-50.

I have a dead BP-3 ICOM battery pack. HRO wants $65 for a new one. Seems like you could replace the cells in it yourself for a fraction of this. Has anyone tried this or know reasons why it should or should not be possible?

Also, is there a way to run the IC-2AT on external DC without a battery. It isn't obvious how to do that from reading the manual.

>HF receiver? What are the implications of LO spurs in a DC receiver?

I do get some weird noises at certain frequencies when tuning across the
band, that I don't get when I use a signal generator as the LO. They are
probably caused by the spurs. I will be experimenting with a PLL to
clean up the output. Phase noise from the DDS clock will also degrade
the Rx performance. ADI has an app. note describing a 125 MHz discrete
component oscillator circuit which has better phase noise performance
than the usual packaged oscillator.

Sure - it's easy if you can find a supply of the 2/3 AA size cells,
preferably with solder tags. At least three of the large component
suppliers in the UK have high-capacity cells that are even better than
before, so there's sure to be a source in the USA.

>Also, is there a way to run the IC-2AT on external DC without a

Take out the dead cells and put a 7809 in the battery pack, on a piece
of aluminum as a heatsink. Works fine in car or shack.

> six meteres, the 2-way toy
> communicators on 49 MHz (radio shack et.al.) should be much easier to
> convert. Come complete with

TWO reasons,

1. Cordless phones have much better clarity and RANGE
than the Radio Shack 2 way toy, or other such 2 way
toys and even the synthesized 2 way RS toy communicator.
This plus more channles

2.FULL DUPLEX comm. This might be important
if you decided to run a digital link over this channel.
This might come in handy to make a small RF modem out of this
cordless phone.

This ain't possible with the toy, as that is only simplex.

Plus, a cordless phone looks much less suspicious to your
neighbors than a TOY 2 way with antlers !!!

4604. Re: No-loss coax?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-02 00:00:00 UTC
From: dlhough@vegas.infi.net
Message-ID: <6if14g$3bs$1@nw001t.infi.net>
Source record: 83278

This is partially true. Actually it is a negative loss coax. This coax actually exhibits a roughly logrithmic power gain starting at 5 mhz. and extending up to 12 ghz.

During World War II the secret was revealed to the OSS by a group of Nazi scientists seeking to escape Hitler's Germany with their families. Contact was made with OSS agents working undercover in Bavaria and the OSS brought this information to the attention of Gen. George S. Patton's Intelligence group in 3rd Army. Gen. Patton wasn't much interested in coax so it was passed on to SHAEF who in turn passed it to the Pentagon. Much was made in using the negative loss coax in the now known Philadelphia Experiment.

The Philadelphia Experiment essentially involved creating an electromagnetic field around a ship to cloak it from enemy radar. Significant amounts of electrical energy were required to power the aparatus needed to cloak ships from radar, too much in fact to make it feasable. But negative loss coax made the Philadelphia Experiment possible by virtually eliminating the need for the huge power generators needed in megawatt RF amplifiers.

The secret was actually of little use to Hitler because he was in a total state of denial concerning the direction the war was taking, but the German scientists were spirited out of Germany and brought to the United States and given U.S. citizenship under a little known Presidential decree.

The secret of negative loss coax has been suppressed until recently because of concerns over the Cold War and fear of causing a breakup of OPEC which would destabilize oil prices.

No U.S. manufacturer was allowed to "bid" as it were, on this technology since most U.S. corporations are owned by wealthy males who by 1960's reasoning and definition are evil, so the technology was transfered under a little known clause in the U.S. foreign aid program.

The secret eventually wound up in the hands of the Red Chinese because left wing members of the Council on Foreign Relations and the Trilateral Commission felt the Red Chinese, being a closed society and a third world nation would keep negative loss coax under wraps while domestically making Mao's "Great Leap Forward" a reality.

The Red Chinese weren't to be depended upon totally. In the 1960's they had experimented with negative loss coax enough and some of it was demonstrated to Gene Roddenbury who worked the idea into the Romulan cloaking device in the early Star Trek series.

With the Cold War at an end, the Red Chinese now wanted to market negative loss coax and export it to the U.S. Knowing that the U.S. only keeps secrets from its own taxpayers, the Red Chinese have been quietly marketing

the coax through a network of Chinese fast food restaurants located along U.S. Interstate highways.

But again this poses a problem because the negative loss coax, in large enough lengths, is key to the widespread manufacture of automobiles that run on nothing more than ordinary tap water. A consortium of world auto makers, petroleum producers and their labor unions have been working secretly to supress this knowledge for several more years, until microchips that manipulate human behavior can be implanted into the neural systems of all children at birth.

>should not be possible?

I rebuilt my BP-3 and it was very easy. The pack originally had 7 small 250mah nicads. Radio Shack offers replacement packs for cordless phones which use cells of the same physical size, and slightly higher capacity (270mah). I purchased a four cell pack and a three cell pack, wired them in series, and put them in the BP-3 case. That was a couple of years ago, and I've not had any problems with it.

BTW, The battery case for the RS handhelds fits the 2AT, and can be ordered as a replacement for much less than the ICOM case.

>Also, is there a way to run the IC-2AT on external DC without a
>battery. It isn't obvious how to do that from reading the manual.

From what I 've been able to determine, the 10.8v offered by the BP5 is the absolute maximum for the 2AT. Running it directly on 12v, or in an automotive envronment where the voltage can go several volts higher would be asking for trouble.

I took a dead BP-3, and put a 7808 regulator inside on a heat-sink. I put the ground terminal through a diode to bump the voltage up to 8.7, which is as high as I want to go. On the input I added a small filter to take out the noise of running it in a car, and it has worked reliably for me for many years.

On a related topic, does anyone know where to get replacement cells for the ICOM BP-180 packs. These are larger 600mah cells which measure approx. 5/8" in diameter, and just over 1" long... (and what a job it was to cut the pack open!)

> degrees.

I don't mean to be slow but, I guess I'm just slow. I assume you're not talking about an external phase shift since then you could just use one part and phase shift its output. And the AD9850 has an internal 90 degree phase shift which sounds like just the thing. What I don't see is how you set the phase accumulators in the two chips to start at zero at the same time so that internal 90 degree phase shift in one is 90 degrees relative to the other chip's phase accumulator.

It seems like you'd need a way so that each time you download a new frequency and phase into the two chips they would wait until you pulled on a separate pin to start running at the new frequency so you could keep the two chips in sync. This assumes you can start in sync somehow. The datasheet seems to just not talk about these points so I assumed it didn't have the capability.

4610. Solar Power by Field Day...Possible?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-02 00:00:00 UTC
From: Al Lorona <Al_Lorona@hp.com>
Message-ID: <354BDDA3.7B1@hp.com>
Source record: 83284

Objective: To install a solar panel to keep charged a bank of large NiCd cells to complete my HF station's self-sufficiency and allow 1E operation during Field Day.

Specifications: NiCd battery, eleven (11) 100 A-h cells, approx. 14 V total. Total load 1 A (receive), 11 A (transmit). Southern California location.

Information Needed:

1. The manufacturer and model number of a panel that has been implemented successfully in a similar amateur emergency power application.

2. War stories.

Thanks,

Al W6LX

Hi Ed,

Given the transient nature of your interference, suppression at the source is a problem for which I have no good answer. Even if jamming was legal it wouldn't likely help. You would interfere with yourself! Would also probably elicit even more from the truckers in retaliation.

All may not be lost. You might be able to make your system more immune to the signals. Not a bad idea, since fully legal signals, should transmitters pass by, can cause the same problem. The amp is acting as a receiver as well as an amp - it shouldn't, but apparently is.

A likely point of entry for the interference is the power line. A GOOD filter on the power line where it enters the amp may help. Beware of "junk", cheapo filters. Another very likely point of entry is the input line (guitar?). "Bypass capacitors" of the right value at amp (and maybe instrument) will short-out interfering radio freq, but not the signal from the instrument. Exact values will vary with details, but would expect 500 pf -to- .01 uf will be the value needed. Another trick is to slide ferrite beads over the line and instrument cords.

Woody

2^10 (1024) bits may be a bit overkill. Surely 64 (or less) would suffice.

That 11A on tx is a killer. We've done FD several times on a solar
charged car battery. We used to bring a backup battery, but never
needed it. We use QRP, mostly CW except sometimes a little voice on
the satellite.

Give QRP a try, you can make almost as many contacts, they each count
for more points and you need a lot less power.

I'd agree. With QRP your rig won't draw 11A but more like 500mA. That's about 1/20th the current. However, for this to happen, you need the right rig - a QRO black box turned down to QRP is very inefficient, so a homebrew rig or specialist QRP rig (eg Argonaut) is best.

To give you an idea of what can be achieved, I have a homebrew DSB/CW transceiver for 40m. I don't know its power consumption, but it puts out about 4w. I can run it off 8 C-size nicads (about 1200 AH?) for about 2hrs of solid operating. When tried in a field day contest, it made about 30 DSB contacts in 2hrs from an average site and below average antenna. This may not seem much, but it was possible to make contacts to all stations calling CQ except one (who was 1600-2000km away).

CW should be even more effective.

I believe it's possible to digitize at that rate. However, you need a dynamic range of something like 2^10 bits (or more) to make a good receiver.

DSP methods at IF and AF count on having the AGC system reduce that dynamic range. Some DSP's even incorporate their own AGC systems to address the problem.

Yes, but not with the required dynamic range ... the digital
domain is moving ever closer to the antenna, but it's not all
the way there yet ...

10 bits is completely inadequate to handle the dynamic range required
of a receiver ... even 16 bits is not really good enough. This is why
it's still necessary to have some analog signal processing (mix to IF,
some filtering, AGC, etc.) ahead of the quantization and DSP.

Check out the vendor ads in model railroading magazines. Some offer pages
of blank decal stock (81/2 x 11) for use in laser/ink jet
printers.
After printing your custom labels, just cut, soak in water, and apply
like commercially printed decals.

The extreme weak signal crowd seems to believe that a direct conversion
receiver gives better performance for extremely weak signals than a multiple
conversion receiver. See the GNOME site www.ao.com/~gnome for some info
on a weak signal receiver project built around the Rick Campbell receiver and
an EZLITE kit. Or go to www.nitehawk.com/rasmit/ for all sorts of DSP goodies
and weak signal information (really cool site).

Actually it's already there... Except this time the television broadcasters have beaten us there with digital television transmitters. They are a special type of transmitter that transmit DTV signals..

For more information, and for information on digital television transmitters check out the SBE web site or the Harris transmitter company web site.

The SBE site is www.sbe.org I believe, but I'm not sure about Harris's...

"Digital TV" has NOTHING to do with what we were talking about ... which
was sampling right at the antenna with an A/D converter and doing the
entire receiver in DSP ...

The digital TV stuff does NOT do that ... most have an IF ... some do an
I/Q mix to baseband and filter there prior to the A/D ... that is called
a "zero IF" or "homodyne" technique.

A DTV transmitter doesn't really have much dynamic range to worry
about. If my memory serves, only 8 different signal levels are used,
representable with 3 bits. A receiver (digital or analog) has a lot
more levels to deal with!

A quick check (my math could be WAY off!) suggests 30 bits are
necessary to approximate the dynamic range of a modern analog
receiver. I'm sure it's *possible* to build a DAC that wide & capable
of operation at 60MHz, but I'm not sure anyone could afford to buy
it...

Okay, here's my dilemna.
I play guitar. I have a guitar amplifier. I live along a well-traveled highway.

When the amplifier is on, I pick up amplified cb signals from truckers who have illegally amplified cb rigs. I have to hurry and shut the amplifier off, because even with the volume turned all the way down, the signal is amplified loud enough to leave my ears ringing.

Also, I am worried about damage to my amp, I have a 1965 Fender Super Reverb, which runs on vacuum tubes. This amp is a highly sought after piece.

I am pissed off beyond belief at these hillbilly jackasses with their cb radios. Is there any way to stop this? or to jam their signals? I don't care if it's illegal, after all, no one can trace a 10 second burst of interference. What they're doing is illegal too.

The volume control won't help, because the interference is being picked up
after the volume control.

It's possible for a legal CB to cause interference too, but your assumtion
that amplifiers are involved could be vaild as well.

: Also, I am worried about damage to my amp, I have a 1965 Fender Super
: Reverb, which runs on vacuum tubes. This amp is a highly sought after

It's VERY difficult to damage a tube amp, except maybe the speakers

: I am pissed off beyond belief at these hillbilly jackasses with their
: cb radios. Is there any way to stop this?

You won't have much luck stopping them.

: or to jam their signals?

Jamming them would have no effect.

: I don't care if it's illegal, after all, no one can trace a 10 second
: burst of interference. What they're doing is illegal too.

Your best bet is to throw caps and/or inductors(ferrite beads will do) on
the tube grids.
But first, try unplugging the guitar cable-if the problem goes away, then
if the plugs open, put a ferrite bead on the center lead on both ends, if
that helps, but not enough, then use a low value ceramic cap across the
center and shield leads in the plugs-the value is not critical, but if you
use too high a value, your guitar will sound muffled(loss of high freqs).
Start with a .01 Mf or .05 Mf to start.
If your cable has molded plugs, then put the parts on the jack.

I have a pair of new in the box Eimac 175A power tubes. Plate dissipation is 400 watts per tube, similar to a 4-400A. If anyone is interested drop me a line and make me an offer. I picked them up years ago to build an Amp, and never got around to it.

Tnx

You don't need an amplifier. Chances are you are using it to amplify childrens yang twang crap rock anyway and that is worse than the hillbillys innanities. Besides, the truckers are bringing me my lettuce and grapefruit so leave them alone and leave your amp off. OK?

I could not find such information in the datasheet either.
I would start the same way as Leon suggested to get near 90deg phase
relationship.
Then I would use a phase detector with very high sensitivity to get an
accurate information about phase (e.g. +/- 2deg FS) If You change the
frequency of one DDS slightly, the phase relationship to the other will
change. Use a small uController to do this PLL loop and you should end
up with a I/Q oscillator with high phase accuracy.

4640. Weird potentiometer

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-04 00:00:00 UTC
From: nospam@no.spam
Message-ID: <354d923c.11491865@news.lin.foa.se>
Source record: 83215

Hi
a friend just popped over and asked me if I could help him to fix his old (20 odd years) JVC amplifier (audio), sure no probs I said, until I discovered that the volume potentiometer needed to be replaced. This potentiometer has a center-tap, i.e. if the wiper is in the middle there is zero ohms between the wiper and the "extra pin". Exactly half the resistance value of the pot when wiper turned either fully c.w. or c.c.w.

1 What is the use of this extra pin? Automatic loudeness or what???

2 How do I find a replacement? Is it possible to substitute the thing with a standard part plus external resistors??

This component is totally unknown here and any enlightment of the usage would be greatly apreciated!

Cheers
LM

4641. ValueTronics - Dayton List

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-04 00:00:00 UTC

Pre-Dayton-Hamvention Sale and Spring Cleaning

We often load up trucks full of equipment and go to the Dayton Hamvention. It's fun to meet many of the people we talk to and get away from the office. There is considerable expense in doing this and we would like to try a better way.

We have compiled a list of equipment that "would have gone to Dayton" and made it available in a file that can be sent via E-Mail, FAX'd or even U.S. Mail. We propose to make available a:

Tektronix List Available on 5-4

Hewlett Packard List Available on 5-6

Other than Above Available on 5-8

The Tektronix list includes: 7000 Series Mainframes and Plug-Ins
400 Series Portables
TM500 Mainframes and Plug-Ins
Fixtures and terminations
2200 Series Portables
Cameras

If you would like the list E-Mailed, it is available in Excel and Test formats.

To get the list, either visit our web page http://www.valuetronics.com or E-Mail us at sales@valuetronics.com or valutron@aol.com. Tell us where to send it and we''ll attach the file to a return E-Mail.

This is a bidding process. The bid closing dates will be listed on the files.

The equipment is available to the highest bidder(s), no accessories are supplied nor warranties implied. We do offer an unconditional evaluation period on all the products.

Nick, I can't send you this to your "nospam" address, but we need a
little help here in the US. I don't have a HPGL manual to look it up,
but somewhere in your initialization string, you are specifying A4
paper. My printer doesn't like this!

We need 8-1/2" x 11" paper size initialization.

Thanks,

Al - K8EUR

Check to see if this is a "Linear" control. If it is then
the center tap may have a resister tied to ground or
the low side of the control to make it into an "Audio
Tapered" control.

You can purchase controls that already have the
"Audio Taper" resistance built in. Then you don't
need to connect the tapped resister. Just measure
the total resistance of the control (Usually 5K, 10K, 25K, 50K, 100K, 1M)
ranges. The higher values usually used in tube sets.

Oops! I forgot you guys used a funny paper size :o)

it's in this line...

'reset & set up the printer to GL mode using mm as plot units
PRINT #1, Esc$; "E"; Esc$; "&l26a0o0E"; Esc$; "*p0x0Y";

Replace the "26" with:

"1" for Executive
"2" for Letter
"3" for Legal

So 8.5 x 11" reads
PRINT #1, Esc$; "E"; Esc$; "&l2a0o0E"; Esc$; "*p0x0Y";

Any other probs email me - nray AT globalnet DOT co DOT uk
(sorry, but spammers are getting a little too active of late)

The tap is for "loudness" control, which changes the frequency response as the volume level is changed to attempt to imitate the changing response of the ear with volume. In the implementations I've seen, a C or RC is connected from the tap to ground.

I don't know of any way to imitate this with a standard pot. You might be able to get a tapped pot from one of the larger mail-order companies, since they're still used. (I purchased a small Radio Shack stereo amplifier not too long ago which used them.)

High power antenna tuner built around aq EF Johnson rotary
inductor (no part number) that is about 4" in diameter and about 6"
long. Huge high voltage air condensers. Unit is marked as 10-160
meters. Needs some TLC but will sell for $90 plus UPS. The
EFJ inductor is worth that much. Have never used it, another of
those treasures that has stacked up in the garage over the last
45 years...

Good Advice,

I started with the TS-520S. It is very similar to the TS-830S (which is a great solid radio). The 520 can be had for about $250. It does not have all the features of the 830, but it is also solid and about half the price.

Hi
I have two I am willing to sell an Icom IC-202 with manual works fine
but the nicads are a bit tired(c cell size) $150 and a Belcom LS-202E.
This little gem is a handheld FM & SSB that was sold only briefly in the
USA under the Santec name. There is a review in the December 85 QST.
Comes with complete documentation. I will scan some stuff in on it and
post it in a week or so. Have never seen anything on the market like it
before or since. I used to use it backpacking but have tapered off a bit
on that and been thinking about selling it. Price TBD

Not too supprised that it is not at the large building supply stores. A possibility would be checking out gutter and roofing companies (as compared to the lg retail outlets). Good luck _Woody_

I once needed a bunch of sheet copper in a hurry (I needed to shield some
equipment on the top of the Empire State Building ... RFI city!). I found
some in a surplus store on Canal St in NYC. You may also want to find a
a store that handles 3M industrial products. 3M makes a copper tape with
conductive adhesive that is extremely handy.

There are some nice pages at http://www.dallas.net/~jvpoll/dup6m/dup6m.h
tml (last time I looked) showing how to build cavities for 50MHz and up
using off-cuts of 3in heliax. They've been tried, and they work well.

When the audio amplifier tends to pick up RF and the level of
interference is independent from setting of the volume control, I find
that the most effective way is to use ferrite rods and wind the AC
cord and speaker cords. This cures 90 per cent of all problems!!
Bypassing with capacitors can affect the audio sound and in some cases
turn the amp into an oscillator.

My new email address is bix@san.rr.com. The brooktree.com email will continue to work for a little while more, and will auto-forward to my new email.

If you are having trouble printing the new .pdf format schematics (I have heard from a couple of people having trouble), send me an email and I will send a set of schematics to you which are hopefully free of any printing problems, and are black and white instead of color so they print better on some older printers.

I encountered a similar device more years ago than I care to tremember,
and it was replaced with a pair of pots stacked, and calibrated with a set
of external resistors. You will figure out the network yourself, but I think
it was a fairly simple system.

good luck.

To the best of my knowledge, the S2001A is a Kenwood part number. I believe
the tube you are looking for is the famous (and fairly common) 6146. My
TS-520 uses a pair of 6146W's in the finals. Just about any matched pair of
6146's should work. I recomend the 6146W's over the 6146A's or 6146B's. They
seem to be build a little heavier.

I've never personally replaced the finals in a TS-520S (530,820,830),
but my understanding is that the S2001A is essentially a 6146B.
My brother bought a TS-830S in which the S2001As had been replaced
with mil-spec 6146Ws, and it works as expected, I suspect all that
is required is replacement and neutralization.

Try putting some ferrit filters on you power cord and speaker leads.
You should be able to get the information on how to do that from a
book on Amateur Radio in most libraries.

Good Luck,
Bob

Hi Steve,

The DTV transmitter is not "digital" at all. It is in fact a very
LINEAR (read: analog), band-limited transmitter (required for the
transmission of the (8 level?) compressed TV/Audio information. The

linearity has to be even better than for a normal analog TV/Audio signal.
This info is at the site you indicated: www.sbe.org.

73,
Don, W6JL

Just about any sheet metal supply company can get you copper flashing.
Jewelry supply houses can get you 6x12 inch sheets very easily. Take a
look on Yahoo. Email me for some places on the web.

Hello:

Looking for an adapter between WR42 or UG-565/U which
is the Leetle Tiny stuff used at 18 GHz, and just about ANY
kind of screw-on connector (SMA, etc).

This waveguide has an internal opening of *about*
a little less than a quarter of an inch by a little less
than a half an inch, is rectangular, and uses a four-
screw (4-40!!) square flange. It almost looks "toy-like"
after fooling around with 2.5 GHz stuff.

Would also be interested in any kind of adapter/
transition from this WR42 stuff to anything a little
larger that I might already have a coax adapter for.

Any good used/surplus microwave "stuff" vendors
out there that you would recommend who might have
this kind of thing?

Thanks for your help!

When this question came up about a year ago, the final word was that the
6146W was equivalent to the 6146A, but not to the 6146B. The proper
replacement is the 6146B.

>
> -- Jim Bowlin

Jim ... run the math ... 10 bits only gets you 60 dB of dynamic range
(best-case ideal).

20(log(2^10)) = 60.2060

That's pretty crapppy for a receiver ... 16 bits only gets you 96 dB.

20(log(2^16)) = 96.3296

Even 16 bits is not that great ... now 24 bits would give you 144 dB.

20(log(2^24)) = 144.4944

That's more like it ... however you won't find a 24 bit A/D with a
fast enough sample rate to allow you to quantize the entire HF band.

One approach would be to do an I/Q mix to baseband, lowpass filter,
then use a stereo audio codec with a lot of bits of resolution.

Another is to upconvert to a high IF, use a xtal "roofing filter" to
bandlimit the signal to 10 or 20 kHz, then either do an I/Q mix to
baseband and do as before, or sub-sample the IF signal directly with
a single converter and do the I/Q generation digitally in the DSP.
(In this latter case, the A/D doesn't have to sample at 2xIF, just
a carefully chosen sample rate >2x the *bandwidth* after the filter.)

Anyway, don't waste your time trying to build a "high performance"
digital radio for the HF bands with a 10 bit A/D if you intend to
place the A/D at or near the antenna and quantize the entire HF
spectrum ... you'd just be wasting time, energy, and parts.

From time to time I'd like to have some small quantities of sheet copper for various projects. I have tried the hobby store, and they have only a few sheets of material maybe 4 x 10" when they do have it, and generally too thin for constructional uses.

I used to see references to rolls of flat copper sheet used for roof flashing, but it seems to be a specialty product anymore. Everything that the local stores have is white, brown or natural finish aluminum. Anyone have any ideas on where to find less than a lifetime supply of this stuff?

Please respond here. Thanks and 73 John... WB4LNM

Answer to your problem...get a good audio frequency filter and put it at
the input to your
amp. That will keep those nasty CBers out of it. Else you might move away
from a major
highway.

You did not say what kind of music you play. If it is not Country Western
let me know where
you live. I am fixing to make a tour of the U. S. I will be running HF
Mbile with a 600 watt
amp and I will be sure to program that highway into my tour.

Hi Roy
thanks for the information!
This confirms our speculations! Yesterday at coffeebreak we did try to
figure out how the RC-network would operate and look like!

One way to replace the pot would be to replace the resistance seen at
centertap with a suitable resistive network so the "loudness" would be
in that position what ever the volume is used. I guess my friend can
live with manually adjust the bass/treble!

Once again Thanks for the help

No, the mixer RF-LO isolation does not get into this act any more
than it attenuates the wanted signal. Unwanted components in the LO act
via tha same paths that the wanted ones do. Sorry.

Cheers

Just wait until someone tries one of those new "spread-spectrum"
clock oscillators that are just coming out as a means to scramble the
EMC components and spread them wider than the EMC test receiver
bandwidth spec!

Cheers

Any type adjusted according to the manufacturer's specs. will work, but remember that the valid bias current is what the valve manufacturer says not what Kenwood says for the original type. Use 6146 or 6146A if you prefer.

Al Lorona <Al_Lorona@hp.com> wrote:

I don't see a problem here, if you have the money.

Siemens makes a 75 watt panel that cost approx. $420 that puts approx 5amps at 14 volts into your battery bank. I am sure there are other manuf. that make larger ones but also cost accordingly. You get the full 5 amps at maximum sun exposure (apporx 6 hrs each day....10am-4pm) and something less in early morning (sun rise) and late afternoon (sun set). If its cloudy, then the imput will be something less also . I estimate that you will get roughly 50 amp-hrs of charging per panel per day, on a sunny day.

So what you need to decide-guess is how many operating hours you are going to do and at what power level. Divide the amp-hrs you will be consuming by the amp-hrs each panel will supply and you will have the number of panels to purchase. Remember to round up to the next whole number of panels. Oh yes, the solar people tell you to add 30% more consumption (amp-hrs) to whatever you figure you will be actually using to determine the number of panels.

Solar power is effective, safe and a do able power source. Yes, it is costly but sometimes and in some locations, it is the most cost effective power source. You don't want to know what is cost to run overhead power lines to a remote site, lets say, a quarter mile away from an existing power line.

Good luck

Call roofing companies and find out who in your area does work on
copper roofs. He will probably have scrap that he is holding to
recycle. My son-in-law used to have a contracting business and did a
lot of copper roof work. He used to let the pieces of scrap collect
until he had enough to deal with.

I used to see references to rolls of flat copper sheet used for
roof flashing, but it seems to be a specialty product anymore.
Everything that the local stores have is white, brown or natural
finish aluminum. Anyone have any ideas on where to find less
than a lifetime supply of this stuff?
Just about any sheet metal supply company can get you copper
flashing. Jewelry supply houses can get you 6x12 inch sheets very
easily. Take a look on Yahoo. Email me for some places on the web.

Hoggs of Sloane St., Birmingham, used to be good for small quantities of
metal sheeting.

Although they recently merged with another company, I expect you would
still find them under Hogg Scientific in the Birmingham Yellow Pages.

I've had no trouble getting it at the building supply places. But I did find that the big chain stores don't carry it. If there is a roofing speciality store in the area try them but be prepared for a minimum order. You will probably wind up with a lifetime supply. I saw some copper valley flashing being replaced on an old victorian home the other day. A full sheet of this should last a while.

The proper formula is 20*log(2^(n-1)) where n is the number of bits.
So your numbers are on the optimistic side for dynamic range.

Pre-Dayton-Hamvention Sale and Spring Cleaning

We often load up trucks full of equipment and go to the Dayton Hamvention. It's fun to meet many of the people we talk to and get away from the office. There is considerable expense in doing this and we would like to try a better way.

We have compiled a list of equipment that "would have gone to Dayton" and made it available in a file that can be sent via E-Mail, FAX'd or even U.S. Mail. We propose to make available a:

Tektronix List Available on 5-4

Hewlett Packard List Available on 5-6 AVAILABLE TODAY

Other than Above Available on 5-8

The Hewlett Packard List includes: Pulse Generators
Function Generators
Scopes
Display Mainframes
Oscillators
Analyzers
Atternuators
Counters
Power Supplies

If you would like the list E-Mailed, it is available in Excel and Test formats.

To get the list, either visit our web page http://www.valuetronics.com or E-Mail us at sales@valuetronics.com or valutron@aol.com. Tell us where to send it and we''ll attach the file to a return E-Mail.

This is a bidding process. The bid closing dates will be listed on the files.

The equipment is available to the highest bidder(s), no accessories are supplied nor warranties implied. We do offer an unconditional evaluation period on all the products.

There will be a one day estate sale on Saturday, May 9, in Barrington, Illinois, about 30 miles NW of Chicago. W9TT, Bill Christman, passed away on Valentines Day. A couple of hams have priced and sorted many of the items. I offered to post the sale on the net, but cannot answer any detailed questions.

Take Rt. 14 NW to Barrington. About 2 blocks past Rt. 59 turn left onto Prospect Avenue, just across from the Ace Hardware store.
The house is the second one on the left.
146.535 talkin.
The sale will run from 10:00 AM until 3:00 PM. Ham radio and related equipment only. On site sales only.

Drake T-4xc, TR-4, R-4c, L-4b, FS-4, power supplies, and more.
Heathkit test equipment
Older 2m FM gear- mobiles and bases
Old scopes
Keyer, mikes
Antennas
MANY old chassis, homebrew projects, components
Many boxes of ????

Priced to go!

Have you tried to "rebuild" the pot. I have had much success in taking them apart (usually by unbending the metal tabs) and cleaning with rubbing alcohol or light scraping with a blade then retensioning the wiper spring and reassemble. This is of course if there is not a mechanical problem with the pot.

Well Dick, I would go with an active filter or 1 or 2 stages using IC Op amps.
That's a cheap and compact way to go, and give sharper response than RC or LC
passive filtering, plus you can get a modest amount of audio gain if desired,
as opposed to having to accept a bit of loss. I use a lot of TL082s, which are
dual op-amp ICs and are stocked at the Rat-Shack. They also work pretty well in
the HAMCOMM/JVFAX interface, incidentally. Check out the 1988 ARRL Handbook,
page 16.28. Formulas for calculating values for High and low pass, band pass,
and band reject filters can be found there, and mention is made of a program,
ACTFILT.EXE, which can be downoaded from the ARRL BBS, 860-594-0306, or from
the ARRL web site, http://www.arrl.org/notes/. Click "DOWNOAD HANDBOOK DISK".

I have several Austron 1250A frequency standards. They are in excellent condition and I will replacement guarantee each one for 1 year. They contain 20 hour battery backup and if left on continuously, will drift 1 part in 10**11 per day. That's like 1 second in 3000 years. They put out 5 MHz, 1 MHz, and 100 kHz sine wave tones, front and back of unit.
I'm asking only $110 plus shipping. They cost $19990 each.

Well, I suppose there's no arguing with beliefs, but whatever
reasoning supports that belief ought to be questioned.

If you're interested in weak signal reception in the presence of big
signals (not at all the same thing as just receiving weak signals
alone..), then a number of early DC receivers got a good reputation
because the recipe of no pre-amp, a medium level DBM and an audio filter
gave better dynamic range than many of the multi superhets of the
commercially made regime. The problem was in poor circuit design rather
than the wrong block diagram.

Cheers

Hello:

Looking for an adapter between WR42 or UG-595/U which
is the Leetle Tiny stuff used at 18 GHz, and just about ANY
kind of screw-on connector (SMA, etc).

This waveguide has an internal opening of *about*
a little less than a quarter of an inch by a little less
than a half an inch, is rectangular, and uses a four-
screw (4-40!!) square flange. It almost looks "toy-like"
after fooling around with 2.5 GHz stuff.

Would also be interested in any kind of adapter/
transition from this WR42/UG-595/U stuff to anything
a little larger that I might already have a coax adapter for.

Any good used/surplus microwave "stuff" vendors
out there that you would recommend who might have
this kind of thing?

Thanks for your help!

>
> Well, I suppose there's no arguing with beliefs, but whatever
>reasoning supports that belief ought to be questioned.

Gary's summary was exaggerated in two respects. One person in "the extreme weak signal crowd", a mathematican by profession, has produced a paper with the following abstract:

"The traditional view holds that during downconversion the RF and LO noises are merely translated to the IF. A more accurate computation reveals that a significant third noise term appears at IF - the result of the interaction between the RF and LO noises."

This paper by W8MQW has been published at a number of amateur VHF conferneces, and appeared in the '32MHz and Above EME Newsletter' for April 1998. No ASCII version is possible because of the diagrams and equations, but a copy should be in W6/PA0ZN's EME Newsletter archives at www.nitehawk.com/rasmit

Extrapolation from the math is that multiple successive mixing processes using several local oscillators, each with significant unfiltered phase noise sidebands, could be a Bad Thing. Hence the speculation - nothing more - that a DC receiver with the minimum number of conversion processes (namely, one) might - only might, not does - give better performance for extremely weak signals than a multiple conversion receiver.

I'm not able to judge the validity of the math, and I don't hold any "beliefs" about it.

>signal.

That's only true if you do low level modulation and follow it with
gobs of linear amplification. This isn't the best way to generate
8VSB. It is more efficient to do it at high level with power amp
modules phased and combined in a 1, 2, 4 power sequence and
switched as necessary to follow the 3 bit encoding.

The phasing has to be controlled on a bit to bit basis to maintain
VSB, but that turns out not to be very difficult. It can be done at
low level. This is very similar to the envelope elimination and
restoration technique which has gained great popularity on
Standard Broadcast except that it is much simpler since the
modulating waveform is well defined and constrained, unlike
analog modulations. A simple bandshaping network on the output
of the combiner will maintain the desired channel spectrum.

But even if you do use low level modulation and linear amplification,
the demands on the linear amp are less than with analog TV because
the peak to average ratio is much lower for 8VSB than it is for NTSC
VSB.

May I suggest?
Don't get any radio.
Get a couple kits, and/or build from scratch a receiver
and transmitter of the simplest possible kind.

Say, a Regenerative Receiver and a CW transmitter
of low power.

Then make 50 contacts using this equipment, and
when you have done so, you will be in a much better
position to evaluate the sound of any receiver and
the reports of any transmitter.

I can't say why, in the space I allowed myself, but it is so.

Good luck.

> "The traditional view holds that during downconversion the RF and LO
> noises are merely translated to the IF. A more accurate computation
> reveals that a significant third noise term appears at IF - the result
> of the interaction between the RF and LO noises."

Example:1) The LO level is +7 dBm.2) The RF noise in a certain bandwidth is -93 dBm.
3) The LO noise in the same bandwidth is 70 dB below the LO level, which would be -63 dBm.
4) The mixing of RF noise and LO noise is then -163 dBm (reciprocal mixing).
5) The ratio of IF noise due to LO noise, to the ratio of IF noise due to RF noise, is -70dB, in other words insignificant.
6) In other words, LO signal (+7dBm) and RF noise mix in the same ratio (100 dB) as LO noise and RF noise. The large value of the LO (+7dBM) and the almost perfect multiplication process preserve this relationship.
7) What can be much more significant is if too much RF noise, at the RF image frequency, gets into the RF port.

I have this crazy idea for a VHF (extendable to UHF) FM transciever.

On the transmitting side, we use a microcontroller (I'm thinking 68HC11 or similar) to read an ADC (connected to a mike), and, based on the value read, we deviate a DDS (AD9850 would be my preliminary choice) from a rest frequency. If we use an IF (rest) frequency of ~18 MHz, we can then do a x8 multiplication to get to 2m, and a x4 mult. to get to 6m from an 25 MHz signal. If we use mixers as the multipliers (feed both inputs with the same signal), we can get quite broadband multipliers easily. Additionally, switching the final multiplier in or out we can get both 6m and 2m coverage in the same rig.

On the receive side, we drive the DDS at a fixed frequency which, when multiplied and mixed with the incoming RF, gives us an IF of maybe 100 kHz. We then limit this, and use the HC11's timers to get zero-crossing intervals. From these, we can drive a DAC to get audio.

So what do you folks think? Am I dreaming, or is this feasible?

[regarding the choice of direct-conversion for a DSP receiver]

My reason for interest in direct-conversion as opposed to a superhet design is that I want to build a multi-RF-channel receiver and do adaptive antenna beamforming in the DSP. This means I need separate analog signal chains right up to the A/D's. (I intend to use a common L.O. for all the front-ends.)

For this application, direct-conversion seems to offer a cost advantage over superhet designs, principly in that it does most of the bandpass filtering at audio frequencies in the sigma-delta A/D rather than in a crystal filter at RF. The gain stages are easier to get, too - simply high-performance audio op-amps as opposed to a high-IP3 IF amp.

One disadvantage of direct-conversion is that it requires half-octave front end filters, while an up-converting superhet with a strong mixer and a high-IF could dispense with the front-end filtering.

On a different subject, has anyone else seen the article describing the design of a homebrew DSP transceiver in the latest QEX? The receiver design is an up-converting superhet with DSP on a 40 kHz second IF.

Digi-Key P/N ARF1157-ND is a clamp-type connector (no crimping tool required). www.digikey.com. Also Pasternack Enterprises PE4084. (My older catalog doesn't show a URL for them. Call 714-261-1920.)

Mouser also has them, but only in crimp type.

Thanks, Bill, I know how to do those sums - but that's ignoring W8MQW's point, which is that the mixing process is not "almost perfect multiplication" and does not preserve the relationships between LO and RF noise.

I don't want to set myself up as a partisan on this subject, or to argue W8MQW's point for him. Instead I suggest that interested parties actually read the paper.

<Develops an odd look and thinks and then says>
Wellllllll, there are conditions in which this mathemetician might be correct. Picture
a
very noisey LO and a single ended mixer or even an imperfect balanced mixer. The LO
and its noise will filter through. This implies faulty design at several levels. But I
have
run across it once, I believe. (I talked the other engineer into using a mixer
balanced to
the LO. It helped.) (Unfiltered RF noise can leak in and affect the IF if the mixer is
not
balanced to the RF path, as well. But the filtering you need anyway helps this.)

Taking your example of 70dB down LO noise at say +7dBm we have -63dBm noise
going into a mixer with say 40dB balance (a pretty good one as commercial jobbies
go.) This gives you noise in that bandwidth at about -103dBm, or some 2.5uV at 50
ohms antenna impedance. That is not particularly good unless you are speaking of a
BROAD (non-female kind {^_-}) bandwidth.

I prefer to refer things to a 1Hz bandwidth. I also get rather upset if the LO is as
bad as -135dBC at the IF frequency. This gives me noise at -167dBm sneaking
through the mixer, which is pretty bad unless you have a decent bit of gain in front

of the mixer. Of course, this is elimiated from consideration with a simple notch at the IF frequency placed in the LO path or with even a slightly cleaner LO.

Any other conversion product that might be at issue will also be at issue for a single direct conversion as well. And these are even more a product (pun intended) of bad overall system design.

For pure weak signal work when there are no huge signals coming into the feed line from the antenna an antenna mounted preamp that gives 20dB or so more gain than the cable loss will pretty much eliminate this as a contender. </Develops an odd look and thinks and then says>

{^_^} Joanne Dow, jdow@bix.com, who wonders if anyone here remembers what can happen in indirect synthesizers with large divisors before the phase detector.

Aside from having some spurious signal issues to deal with this is quite practical. I looked at this just a whole long time ago. DSPs available today
reduce the circuitry count to manageable proportions. You have two terms you work with in the (slow) DSP. One is the fixed frequency you are using for the carrier and the other is the digitized and scaled speech waveform. You add them together and feed that to the DDS as often as your audio sample rate. You can apply any preemphasis, mixing, fancy filtering, deviation limiting, etc yatta yatta, in the DSP quite easily. (If this is not
being used somewhere for a commercial FM station the only reason I could see is DDS spurious or "non-hip" designers.)

> zero-crossing intervals. From these, we can drive a DAC to get audio.

The timers might not have the resolution you need. I believe there is a PIC

chip with a/d conversion available. You "might" be able to implement most of
the computation for transmitter and receiver in that beastie with some modest degree of overall cleverness. Then any fairly clever frequency to voltage converter would feed the A/D just fine. (Especially so since you can
easily scale things in the audio domain.)

The deviation from perfect multiplication would have to be quite large to make an important difference. I have been through this exercise quite often over the years. If we are talking about large ratios of LO signal to RF noise and LO noise, the process is very nearly perfect multiplication. In other words, noise-noise intermodulation would be due to a higher-order process, not perfect multiplication, and would be quite small.

He may have been talking about multi-GHz single-diode radar mixers of some kind that are not like the double balanced high-level HF/VHF/UHF mixers that I know about. If the problem that he mentions is real it would have to be something like that.

The numbers that I gave and that you are familiar with, are directly from my own considerable experience with mixers. I never doubted that you can do the numbers, old friend.

Right. The RF to IF noise leakthrough would have to be at the IF frequency, and the same is true of LO to IF leakage. In microwave circuits these kinds of things can happen, I suppose. My reply is that the general hypothesis is not true in good front-end designs at the frequencies that I am familiar with. For me, the numbers that I gave are very real-world and mixers are very good multipliers.

Good advice from Lou, I think, but a DC receiver is a bit easier to use. Juggling a manual TR switch, a key, the reciever frequency offset, AND the regen control might be a bit more daunting than neessary for a new ham. Also, the DC receiver does not need a pre-amp to prevent emissions by the receiver.

Ramsey's $29.95 transmitter and receiver kits might be a good way to go... very simple kits with excellent chances of getting everything right the first time even by a first time kit builder.

My first setup was a Rat Shack portable reciever with a BFO for CW and SSB, and a homebrew transmitter. I believe it was based on one found in one of Doug DeMaw's books, and I now seem to remember it used a pair of 2N2222s, one for the VXO and one for the PA. I believe I had it set up for keying both stages, but I don't remember exactly. My second transmitter was similar, but used a "driver" stage, really a buffer, and I ran the Oscillator constantly and keyed the final. I think I used a 2N2222 for the osc and driver, and a 2N2222A for the final. I started on a VFO but never got it working satisfactorily and so stayed rock-bound on 40 for a while.

Anyway, I made a few contacts with both before taking the plunge and buying the recently introduced TS-50S, which I still have as my primary rig and reccomend highly. It is fairly inexpensive as new rigs go, often findable at under $900, is very compact, has decent audio for SWLing (especially with an external speaker), and most of the common big-rig features. There is no VOX, computer control capability leaves a bit to be desired, the on-board speaker is a bit small, and the #&X@$!!!! key jack is way in the back, but otherwise a good bet for a first NEW full featured, 100W all-bander.

There is something to be said for not buying a used rig. If you home-brew, who better than the builder to troublshoot, repair, or modify? With a New store-bought rig, you get a warranty. With a used rig, buyer beware. It is possible that someone could unload a lemon on you, or even honestly believe he is giving you a good deal on a rig that served him well, right before the smoke leaks out the first time you fire it up. If you buy a used rig, try it out first before writing that check, if at all possible. Try to work out a return/refund arrangement of some kind. Avoid buying a used rig through the mail if possible.

Your local ham club might be a good place to ask around about a rig. Could be somebody will cut a good deal for a new ham. Who knows... you might even be lent or given an old clunker that will get you on the air untill you save enough nickles to buy a nicer rig. And while dealing face-to-face with a seller does not ensure that you will be treated fairly, knowing the seller's friends will help, and if the guy is a low-life who would rip you off, you will probably hear about it from a self-appointed moral guardian (every bunch of hams has at least one!)

Buying a used rig from your local ham shop isn't the best way to go to get the best possible price, but you should be able to work out a return policy. They want your continued business, so they will have a financial incentive to treat you right. In all likelyhood, the radio has been thoroughly checked out.

Ramsey has a web site but I don't see the URL in my database. There are lots of books for the homebrewer with tried and tested designs, many of them published by the ARRL. QRP CLASSICS, W1FB's QRP NOTEBOOK, and the ARRL HANDBOOK are valuable references for the home-brewer. See the ARRL web site at

http://www.arrl.org

for ordering. Hope this helps.

4758. Solid State DC Motor Rev Control ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-08 00:00:00 UTC
From: gilly@camtech.net.au
Message-ID: <3555a9d4.30500992@news.camtech.net.au>
Source record: 83183
Cross-posted to: aus.electronics,sci.electronics.components,rec.radio.amateur.homebrew,rec.radio.amateur.antenna

During discussions about DC motor control (mainly reversing) , it
was suggested to me that relays are the "old fashioned" way of
achieving motor reversal and that I should be looking at a more modern
approach using Mosfets.

Apparently this would enable motor reversal, softstart, electrical
interlocking etc.

The motor is part of a home made antenna rotator

During a few searches on the net I have come up with no details.

Could someone point me to a URL if they know of one where I could get
some details.

Alternatively, if anyone has a circuit, a copy would be appreciated.

4759. High performance PLL

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-08 00:00:00 UTC
From: larsm@lin.foa.se
Message-ID: <3552cea8.11220130@news.lin.foa.se>
Source record: 83184

Hi
while reading QEX, I suddenly started to contemplate over various type of phase detectors....

Quite a few desings tend to use the MC145159 PLL and its analogue phase detector. Plessey used to have the NJ8820 with similar detector. Newer chips such as the PLLatinum from National all uses digital phase/frequency detector.

Considering both divider noise and phase detector noise, my question to the auditorium is: How much better performance do I get with the analogue detector, noise and supression of reference??

Is there anything published on phase noise from various detectors and dividers?

I have a report published by Tim Royce at MIT (6 june 86) looking at 10 different phase/frequency detectors using 1 MHz ref frequency. Most detectors are of old design, MC145151, 4046B, MC4044, MC 12040.

What would happen if the reference frequency would be lowered??

I have just started to play with the PLL synthesis program from Eagleware, and it looks like a winner. One tends to get very lazy using the computer to do all the calculations for you. It presents both open and closed loop performance and phase-noise plots. And the desingener can choose from both active and passive filers. The only drawback for us hams is the price 995 dollar (lucky for me, company pays...).

Hello, Anders.
I have a Toko catalog here, but the info isn't very good. Here is what I have:
Turn the filter over (bottom view).
Hold it with the long side facing you.
Pin 2 is in the upper left corner. This is the input pin.
Pin 8 is in the lower right corner. This is the output.
All other pins are grounded.
The filter appears to be symmetrical, so it doesn't matter which end you
choose to be the input.

I hope this helps. I too am experimenting with these filters. I have one for
146 Mhz that works very well (different case style).

>Aside from having some spurious signal issues to deal with this is quite
>practical. I looked at this just a whole long time ago. DSPs available

This, in particular, has me worried. The other thing that I don't
know about about are the settling times required for the DDS.

>reduce the circuitry count to manageable proportions. You have two terms
>you work with in the (slow) DSP. One is the fixed frequency you are using
>for the carrier and the other is the digitized and scaled speech waveform.
>You add them together and feed that to the DDS as often as your audio
>sample rate. You can apply any preemphasis, mixing, fancy filtering,

Hm. I don't quite follow the need for a fixed frequency term. I'd
like to just add a fixed offset (for the carrier frequency) to a
variable term derived from the ADC input, and just output this sum to
the DDS (analogous to adding a variable voltage to a bias in a VCO).

>> kHz. We then limit this, and use the HC11's timers to get
>> zero-crossing intervals. From these, we can drive a DAC to get audio.

>The timers might not have the resolution you need. I believe there is
>a PIC chip with a/d conversion available. You "might" be able to

This could be a problem. However, I do not see any problems with just
bringing the final "IF" frequency down to, say, 20 kHz. If all else
fails, a simple PAL/CPLD can implement a high-speed counter.

A 68 K resistor at the grid of the first tube
your guitar connects to and another 68 K resistor
at the tube right after the volume control
should coreect your problems.

The resistors have one end connected to the grid directly.
To do that U will have to pull the grid leak R and C, and then
connect this Suppresor resitor of 68K to grid, and then
connect the grid leaks RC to the other end of the Suppresor R.

This should fix the problems.

I, too, am a newish ham interested in exploring the HF world --- got my tech plus last year and stuck to 2m/70cm FM, then upgraded to general and still stuck to VHF. I'm now taking my first tentative steps into QRP HF, having decided against spending exorbitant amounts of money on HF appliances which will get me on the air with little or no trouble but teach me nothing and cost a bundle.

While I studied for my tech plus exam I built a kit 40m receiver -- found it at http://www.pan-tex.net/usr/r/receivers/ra01000.htm. A simple design, the kit took me only a few hours to get together, although I really didn't do a great job of fitting it to an enclosure and mounting the tuning capacitor nicely. It was good for seeing the principles of the design, and I did manage to tune in some stations to test my code copy. I never did do any of the improvements suggested in the kit plans, such as replacing the capacitor tuning with a varactor voltage controlled circuit, so tuning is a hassle and I don't use it much anymore.

But now I want to get on the bands. So I ordered one of the Wilderness Radio (http://www.fix.net/jparker/wild.html) "Simple Superhet Transceiver" kits. It hasn't arrived yet, but I'm looking forward to putting it together when it does. I'll probably have to beg, borrow or somethingorother test equipment to get the oscillators aligned, but don't see that as my biggest obstacle to getting on the bands.

What I *am* having a problem figuring out is what to do about an antenna and tuner combination suitable for low-profile work that doesn't cost twice as

much as the transceiver.

My first impulse, which I consider a fall-back position should I not find a better homebrew solution, is to buy an MFJ-1621 10-40m portable antenna; this is a telescoping vertical with an antenna tuner and field-strength meter built into the base. A plug and play solution that'll probably work for me, but like I said, I'd rather not go appliance. And at $80 it's almost as expensive as the transceiver kit.

I've looked at the St. Louis vertical design, it looks like something I'd like to build for an antenna, and won't cost much to build. Heck, I could probably even just do a random wire or something, but what I have to avoid is permanent installation type things --- I rent my house and it has a small lot, so putting up a big vertical with the appropriate ground system and lightning protection ain't an option. Field-expedient stuff like random wires that I can take in after I'm done, folding verticals, etc are just the thing I would like to do, and there seems to be no shortage of plans out there for me to use.

But the tuner's another issue. I bought several ARRL books: the Antenna Book, somecall's Antenna Notebook, "Your Ham Antenna Companion" and Low Profile Amateur Radio. LPAR and the Antenna Notebook have given me a hint that I should be able to put together a simple antenna tuner with a homebrew inductor and a commercially available tuning capacitor --- YHAC and LPAR both even show a "windowsill semi-vertical" setup with just such a setup on it, but refer you to a 31 year old back issue of QST for the plans. Groan. And the both the Antenna Book and the ARRL handbook have designs for transmatches that I could probably build, but are clearly designed for the 100+W rigs, and would probably be overdesigned for the little 2W rig I'll be building. Plus the parts required (e.g. roller inductors and fancy turn-counting knobs for the "Ultimate Transmatch") look like they'd be pretty expensive, and again seem chosen for their ability to handle higher powers than 2W.

So does anyone have a suggestion for what I might try or where I might find designs better suited to the low end of the power scale (and the low end of the budget scale)? The "semivertical" deal I mentioned has what looks like a simple inductor with aligator clip taps and a variable capacitor. Looks like it'd be a snap to assemble, and I could probably even wind my own inductor. Anyone have back issues of QST dating to 1967 that I might xerox? Or a more easily obtainable reference? The Antenna Notebook gives some schematics for a T-match and L-match network, but I'm concerned that there are construction "gotchas" that I oughtta know about before trying to build something like that straight from a schematic. While I'm looking forward to building stuff myself and learning from doing, I'm still at the stage where I neet something a bit more cookbookish.

And then, given that I'll have a tuner, I still need to have an indication that I've actually tuned the antenna properly. I'm tempted to try the old-timer trick of using a lightbulb or surplus RF ammeter in lieu of an SWR meter to indicate proper tuning, just to be as miserly as possible and maximize my distance from appliance use :-) The "antenna notebook" talks about them as reasonable options, if inideal. Anyone here do things like that?

Before you spend your scarce capital or expense dollars on specialized dongle-restricted synthesis or analysis software, consider a one-time $975 investment that will obviate the need for much if not all of what you now intend to buy...

The Professional Partnership Program is a site-license providing an unprecedented level of electronic simulation and synthesis capability at virtually no cost per user. For a one-time investment of $975, the Program provides to every engineer and designer company-wide:

Nodal Circuit Analysis with True Two-Node Port Definition
Unconstrained Noise Analysis
Transmission Structure Synthesis & Analysis
Over 40 Single & Coupled Topologies
Strip (Planar) Structures
Wire Lines
Coaxial Arrangements
Waveguide (Non-TEM) Topologies
Passive Filter Synthesis
Lowpass
Highpass
Bandpass
Prototypes
Practical Reactively-Coupled Realizations
System & Receiver Design Support
Link, Terminal & Radar Analysis
System Architecture Characterization
Spurious Analysis
Transmit & Receive
Coincident & Tuned
Preselector & Output Filtering
Phase Noise Analysis
Time Domain Effects
Frequency Domain Effects

600+ Page User's Manual with Examples & References

Join the Program and you will be furnishing all of this invaluable capability to every designer, not just one! Our competitors are furious with us for having created the uniquely progressive opportunity. It seems they're still using dongles to hinder access to their own products.

Please contact me for additional information. Or, see:

Pre-Dayton-Hamvention Sale and Spring Cleaning

We often load up trucks full of equipment and go to the Dayton Hamvention. It's fun to meet
many of the people we talk to and get away from the office. There is considerable expense in
doing this and we would like to try a better way.

We have compiled a list of equipment that "would have gone to Dayton" and made it available in
a file that can be sent via E-Mail, FAX'd or even U.S. Mail. We propose to make available a:

Tektronix List Available on 5-4 SENT ON 5-4

Hewlett Packard List Available on 5-6 SENT ON 5-6

Other than Above Available on 5-8 AVAILABLE TODAY

The "Other thanHewlett Packard and Tektronix" List includes:

John Fluke Mfg., AC-DC Electronics, Advantest, Astro-Med, Anritsu, Arium, Bruel & Kjaer, BK Precision, Boonton, Dana, Data I/O, Dolch, Dranetz, EH, Eico, Elgar, EMI, ENI, ESI, GenRad, Harrison, Heath, Hickok, Honeywell, Keithley, Kepco, KH, Lambda, Leader, LeCroy, Marconi, Narda, Power Designs, Phillips, Pacific Measurements, Quantum, RCA, Scientific-Atlanta, Schaffner, Sencore, Simpson, Sorensen, Tautron, Velonex, Wandel & Goltermann, Wavetek, Weston, Yokogawa

If you would like the list E-Mailed, it is available in Excel and Test formats.

To get the list, either visit our web page http://www.valuetronics.com or E-Mail us at sales@valuetronics.com or valutron@aol.com. Tell us where to send it and we''ll attach the file
to a return E-Mail.

This is a bidding process. The bid closing dates will be listed on the files.

The equipment is available to the highest bidder(s), no accessories are supplied nor warranties
implied. We do offer an unconditional evaluation period on all the products.

Depending upon power requirements, things will vary.

However, if you can use 12-60 volts, max 3 amps, try National's LMD18200 and related ICs, LMD182xx's.

Or if very little power is needed, try L293D from SGS-Thomson, better yet, the TI part SN754410, each about 1 amp max.

These are VERY easy to put a circuit together with. You might also try Wirz Electronics, which I think is: www.wirz.com

They have a couple of boards which use the above parts for around 20 to 50 dollars everything included.

Off topically speaking about grid leaks;
As i remember it, a grid dipper was intended to
replace grids that had leaked from a tube type rig.

There was a grid tank under the bench for the grids
to leak into, (got kinda smelly at times) and the grid dipper
was kept in or near the tank.

They never worked well at this.
Know why?

The Bias on the simple oscillator in a grid dipper?

Grid leak, of cuss.

Wherefore you could not keep the dipper full of grids
long enuff to get them back into the rig.

Thought you'd like to know.

Pleased to see yet another ham taking the plunge into HF! You are setting a fine example for those Techs who are reluctant to go for it for so many reasons. Cost is probaably the second biggest reason for new hams to stick with V/UHF, after the "hassle" of learning the code. FB on your low-cost strategy, and on sharing your kit-building experience.

Rat Shack sells a low cost SWR meter that is popular with CBers, and it works okay down to about a watt of RF. As for the tuner, you can indeed get off very cheaply at such low power levels. #18 magnet wire wound well spaced on a toilet paper tube with a tap point every 3rd turn will do okay for the inductor. You can use a couple of pieces of single sided pc board for the capacitor... call one the stator and mount it copper side up on a pine board. Remove the copper from about half the other board, and place it copper sie up on top of the Stator... this will be the Rotor. The fiberglass substrate of the rotor becomes the dielectric. Capacitance is varied by moving the rotor so that more or less of the copper is in alignment. About 3 x 4 inches should do you. Patch the circuit together with alligator jumpers into an "L" configuration and experiment with different arrangements, tap points, etc. The tiny multigang caps from old transistor radios are okay up to about 1/10 watt, or higher depending on how bad a mismatch is being corrected. Just about any transmitter cap of 300 to 500 pf will work.

MFJ sells a cheap little "L" tuner for random wire antennas for $39.95, or maybe $29.95, I don't remember. It works fine for low power applications, and is rated by MFJ for up to 100 watts. Use the Rat Shack SWR meter and this tuner, run a SHORT lead to a good earth ground, hook up a random wire or inverted "L", and you should be able to make contacts okay with your 2 watter. Should you decide to build a rig for another band, the same setup will work with no alterations other than tuner settings. With the tuned random wire approach, a good ground is not an option... it is a MUST HAVE. If a short run to ground is not practical, for instance you live in a 3rd floor apt like I do, run radials around the baseboard, along the ceiling, out the window, whatever, with at least one 1/4 wave radial for each band. The more the better!

My ant is 100 feet of electric fence wire out the window tuned with a $69.95 MFJ-901B versa-tuner with one baseboard radial cut for 20 meters and the other for 17. No, it is not as good as a properly constructed inverted vee, but it works "okay" and fits well with the physical layout of my QTH. I use the RS SWR meter. I run between 5 and 100 watts and manage to match up to any band well enough to make a few contacts.

Speaking of inverted vees, can you use one at your QTH? You will not need a tuner with a properly cut dipole, and only need the meter for initial setup of the antenna. This is a great, cheap antenna, and you do not really NEED to use a balun, in spite of what some will tell you. Also,grounding is not as

critical.

I don't know about he lightbulb trick...I don't reecall seeing it done at QRP levels.

Test equipment? Probably all you will need is a VOM and a SW reciever that has BFO, or another ham's rig with general coverage receiver. Use the receiver to verify the frequency of your oscillators and make calibrations. Just put the reciever's whip antenna close to the oscillator and you should hear it OK if you are on freq. For the recieve circuits of your homebrew transciver, make a probe to clip to the test receiver's antenna and follow the signal through the mixer, IF, to the detector.

If you don't have one, you can make a serviceable key out of a drawer knob, hacksaw blade, piece of wood, and a dozen wood screws. To get fancy, solder relay contacts into drilled-out screw heads for contacts. MFJ recently introduced a cheap key too.

Hope this helps, OM. Also you might find useful info at my seb site. URL is in my sig.

4776. Re: Prospective Tech-Plus licensee needs radio advice....

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-08 00:00:00 UTC
From: !*dimitrip@tiac.net
Message-ID: <35538c40.21730503@news.ecom.net>
Source record: 83201

As far as getting on the HF bands without spending too much. There are
always a few TS-820S out there for sale. Usually around $300-$400,
sometimes yoy get reaaly lucky and see one or two with some "problem"
for much less. I got mine for $220 and I am using it with a 6 meter
transverter. Granted the older radios don't have the bells and
whistles of the new ones ...but heck they get you out there.

4777. Heathkit RF gen IG-102 tube numbers ??

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-08 00:00:00 UTC
From: Michael <me_hamman@yahoo.com>
Message-ID: <3553a133.0@news.snip.net>
Source record: 83202
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.swap

Does anyone have a schematic of the Heathkit
IG-102 100khz to 110mhz rf generator. Mine died
after many good years. I can only guess that a tube
has gone on to better worlds. My problem is that
only one tube has ID numbers on it (12AT7) the
other tube is a 6A??A. If I can't get a schematic
can someone out there tell me what the 6 volt
tube's number is supposed to be??

Thanks

If you used a carrier of 10.7 you should be able to nail most of the spurs with an inexpesive crystal filter. I beleive that most of the DDS circuits are pretty good for close in noise so as long as you could remove the harmonics and other spurs from driving clock you should be OK. The problem that I see is that the AD9850 quotes starting the new frequency in something like 13 clocks from the end of setup and immediately is on the new frequency with no smooth transition from the olf frequency so there would be sharp steps in frequency with fairily strong phase errors, some sort of over sampling to get more smalller updates and good filtering may reduce this to a reasonable limit.

4779. UTC CVP-3 Pin-out Wanted

Newsgroup: rec.radio.amateur.homebrew

Hi. I have a UTC CVP-3 audio output transformer but don't know the pinout. According to the ohm meter, there are 5 separate windings. Can anyone send me the pinouts? Thanks in advance. Ted. N1XLW.

I have these four types of w.g. items: about 10 ea. WR-90 flex guide (22" long formed into a "U" shape) all new in the box $6 or 4/$20; about 80 or so WR-90 to WRD-475 (double ridge) adapters, good used, $4 or 4/$14 ; about 12 WRD-475 to WR-187 w.g. transitions, new in box, $6 or 4/$20; and about 15 WR-159 straight flex sections, new, 22" long, $7.50 or 4/$25. Drawings available on all four items. Email or call 334-347-5281 (Alabama). NOTE: Please REMOVE the "nosp-m" from address when replying. Thanks.

4781. peanut whistle setup

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-09 00:00:00 UTC
From: Bill <whagen@NOREPLY.inreach.com>
Message-ID: <3553CD8B.7484@NOREPLY.inreach.com>
Source record: 83058

here is my setup.
I hooked the peanut whistle 40m transmitter up with a dx440 reciever, an 80286 computer, with an AEA pk232 controller. I used the keyer and the ptt on the 232 to control the key on the peanut, with the ptt controlling a relay to switch the antenna from tx to rx.
The whole thing works nice, also have a straight key hooked in to the system to tx without all the computer stuff.
I found the pk232 allows the peanut to put out a cleaner signal than the straight key, presumably because the key bounces.
enjoy.
whagen@inreach.com

What kind of net is it that is listed in a Hate Directory and needs a support
Group?? Are they recruiting more jammers in an effort to run
other operators off of 3950 and jam those that don't leave.
Also it sounds like it may be to indoctrinate some into the sub-cells that
are used by the western imperative network , a white supremist organization
that some of the "So Called" net members belong to. To find out more before
you sign up for any e-mail list check out http://www.usaor.net/users/ipm/
This is the net supposed Folk?? Journal web Page and is also the page for the
western imperative network read some of the stuff there.
LOOK at all of the pages I have listed below to find out what the "So Called"
Net is really about. take the
http://www.officer.com and then take the hate directory and about 90% of
the way down that page you'll see the
"So Called" Liberty Net listed as a HATE GROUP!

>

According to my 1966 UTC catalog (never throw anything away)...

The rating on this tube to line or voice coil transformer is 60 W
audio designed for PP applications with a primary impedance of 3000,
5000, 6000, 8000, 10000 and 14000 ohm center tapped.

The seconday output impedances are 500, 200, 50, 16, 8, 5, 3, 1.5 ohm.

No schematic is given, I believe that was usually printed on the can.

There are some "recommended" circuits shown, but none of them show the
use of this particular transformer.

Sorry I can't be of more help.

Looks good, I think I'll put it into Protel (schematic). I may be able
to lay out a pcb - I have the pcb add-on but to be honest I find it a
bit tricky to use and have never got it to lay anything out for me!
(Maybe I'd better RTFM!)

I've always preferred to try and work with a minimal amount of equipment, don't fail to consider amulti-element dipole, I've got one for 40/20/15 that works great, I used pvc to separate the elements
3 bands, no tuner, I've added 80m to it on a temporary basis with no interaction with the other bands.

Unfortunatly it sounds like you don't have the room or ability to put up a permanent antenna, you might consider a long wire attached to a spool with heavy rubberbands inside, when your done, the long wire retracts like a fly line. I did this once and am working on a new and improved version. For QRP you could even use a real fly reel and #22 wire, then just test clip the coax to the wire.

Good luck,

Tim

I have a brand new 4CX400A I want to put on 50 Mhz and eventually I plan to have a single tube running on 144, 222, and 432 Mhz on a common HV supply.

Tube Specs are 610W out to 500Mhz. Uses the 4CX250B Socket/Chimney. Probably the best bang for the buck up to 500 mhz on the market today!

Anyone useing this tube at VHF+ or have experiance with the 250B, I have a few questions.

73s de Tim - K7XC... sk
Email: K7XC@vhf.reno.nv.us

Look for K7XC atop 9000' Mt Moses NV in DN10 this June VHF QSO Party.
QRV 50, 144, 222, 432, and 1296 Mhz SSB / CW.

I recently brought home a cheap <free> semi messed up 6m amp.
UPS had dropped it, and smashed the insides a bit. The amp still
looks functional, but when it is turned on, I see blue coronas under
the tubes <as if they are on with no signal> The tubes are actually
jan 8321 amperex, and there is a 2000 volt 500 mil continous/700mil
intermittant transformer. There is 4 rectifier tubes and one very
large volume blower. I also have a coaxial relay with the unit. I was
wondering....
Is there anyone in the DFW area that could look at this amp, and
tell/show me how it works and what may be wrong helping me fix
with compensation of course, if so please respond.
I am curious and anxious to get this amp online. I may decide to
rework it into hf/vhf/uhf use depending on the ease of doing so.

thanks in advance for any/all who reply

>jhoyos@ou.edu

Of course there are. However,they are generally only in lowish
resolutions -& you pay more than for the slower ones.
The AD9054-200 does 8 bits at 200 Megasamples/second.
However,it costs $48 in quantities of 100 !!!
Tektronix make some at 500 MHz (used in their high speed
oscilliscopes) & I believe Sipex have some fastish ones also.
Once you get above these frequencies,you normally have to
mix down to a lower frequency.
However,there are "undersampling" techniques which allow
the use of a slower sampling rate ADC than your frequency of
interest.In these cases the analogue INPUT BANDWIDTH
must be wide enough to cope with the signal bandwidth of
interest.There's normally a wide bandwidth track-&-hold (sample/hold)
circuit -usually built into the ADC.
The ADC sampling rate must be at least twice the bandwidth of the
required signal.
Read some published info on "undersampling" to get more background.

Yes - I put out a note on the VHF reflector a few weeks ago. Search DejaNews for "4CX400A" on all newsgroups and lists, and you're sure to find it.

The 4CX400A works "as advertised" on all VHF bands. I've had over 1kW out from two tubes in W2GN-style amplifiers on 50 and on 144. That's with 2.5kV B+ at 800mA total anode current - you won't get the RF power out unless your B+ supply can deliver that.

OZ1RH gets 500W out of a single tube on 432, but the K2RIW two-tube amp needs some redesign in order to give good efficiency with a pair of 400As.

Drive sensitivity is spectacular with 375-400V stabilized on the screen. You can almost get full power output with zero grid current, and the Svetlana data sheet does allow up to +2mA grid current per tube with good IMD performance. The 50MHz amp has the grids swamped by four paralleled 1k resistors, but still gives >1kW output for only 2.5W of drive!

Down East Microwave should have metalwork kits for a new 2-4CX400A amp for 144 on their stand at Dayton (if they get across the Atlantic in time from over here). Also they will definitely have kits of 'Tetrode Boards' and components for a power supply / controller / T-R sequencer unit based on my article in QEX for October 1997.

More details in the "what's new" section of DEM's web site, at http://www.downeastmicrowave.com

CD Quality Cable Stereo Receiver
- and -
50-150mHz RF Communications Electronics Bonanza

StudioLine COMPANDING FM RECEIVERS (See Photo) with
up to 90db audio s/n ratio for Cable
(and other RF Distributed) consumer and professional Audio.

Complete specs functional descriptions of electronic modules
and many images of handsome enclosure and circuit boards
is on display at:

http://www.lasermotion.com/DEALS.html

WHAT THEY ARE: Three RF receivers in one box with "F" connector input,
and RCA phono outputs for two channels of audio.
Two receivers are FM audio channels, can be tuned (VCO Circuit) 50-150mHz
and the third receiver (at 50.675MHz with 10.7MHz IF) is dedicated to
optional control and programming functions.
The audio section includes the 3:1 "expander" section of a companding system.

(Original (OEM) Large Quantity Manufacturing Cost in Japan = $321 /each)

THE STORY: StudioLine technology for economically distributing truly
studio-quality audio programming over existing Cable & Wireless broadcast
systems was originally developed by FM Systems, Inc.., Santa Ana, CA. with
funding provided by The Chronicle broadcasting company in San Francisco,
CA. We acquired the equipment and rights. Pricing is very affordable.
Head End transmitters are available inexpensively from
FM Systems, Inc., Santa Ana, CA.

The units are unused and in original manufacturer's packing.
Schematics and technical info is included.

Shipping weight: 7.5 lbs.
You pay UPS ground shipping. We pack it for you.

So am I. I built the interface out of the Feb issue of 73 magazine.
Works fine controlling my IC-706MKII and when VK2QQ was here last
month we controlled his R-10 receiver also.

In looking at the codes for controlling the rig, they are extremely
limited. I will probably use the software only to load the memories.

Which radars need that much _bandwidth_ ? A typical search radar has about 1000 ns pulse width and the receiver needs about 1-2 MHz bandwidth. With 100 MHz receiver bandwidth, a pulse width of 5-10 ns would be required to take full advantage of the bandwidth, but the narrow pulse would reduce the average output power.

>>Is there any ADC that samples at so high rate?

> Of course there are. However,they are generally only in lowish
>resolutions -& you pay more than for the slower ones.

One trick is to run several slower ADCs in parallel in an interleaved configuration. In this way, only the sample & hold circuits (for each converter) have to work at full sampling rate fs, but the ADCs only at fs/4 with 4 A/D converters.

I found a pretty good package last night. It's a logging/packet/rig control
package
by VE6YP. So far it seems to work pretty good. It has the ability to feed
dx spots
from the packetcluster to your rig, and your log.

It's available at http://www.logicnet.com/tony.field/

The drawing doesn't exist yet.
Protel creates (when I work out how) the layout, pads, tracks, via's
etc.

4816. What is this transistor? and where did Int'l Microelectronics go?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-10 00:00:00 UTC
From: tiemann@spot.colorado.edu
Message-ID: <6j4vmd$ml9@peabody.colorado.edu>
Source record: 83093

I have some NEC "microwave transistor" with the following identification
on it:

NEC
H175
101

And on the box, "H011751 - 0001, lot 74-1-6, Oct 24 1977"

This transistor is not in any NEC catalog that I could find, and is not
presently known about by the CEL person I talked to. Does someone have an
older copy of the catalog, or could otherwise help me come up with the
data sheet for it?

****

Also, Where did International Microelectronics go? I have phone
1-800-999-0463, fax (817) 473-0525,

P.O Box 170415, Arlington TX,

But they don't answer the phone in a week of trying, and the new 800
nimber (from directory assistance) (1) is in San Jose and (2) is a wrong
number. I would like to get back in touch with them. Please help, anyone
who knows what become of them.

Thanks,

Bruce Tiemann

4817. Simple/cheap antenna system

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-10 00:00:00 UTC
From: Peter Parker <parkerp@pcug.org.au>
Message-ID: <35560e71.0@newshost.pcug.org.au>
Source record: 83094

As for a low-cost antenna for QRP gear, I recommend the half wvelength piece of wire. This radiates efficiently without an extensive ground system. For 40m a 20m length is about right.

An L-match is needed to match the unit. This consists of a transistor radio tuning capacitor and a variable inductor. However, if you are only going to use the setup on 1 band only with the one antenna, the inductor can be fixed (even an RF choke of appropriate value). On 80m the appropriate value is 22 uH for a 40m long piece of wire.

As for a matching indicator, a resistive antenna bridge is very good. However I use a simple field strength meter near the antenna wire - adjust L & C for max output. Some info on a field strength meter (incl circuit) appears on my webpage.

With the above I can regularly have contacts up to 1000km away on 40m with 5w CW and DSB during the day. It is an excellent portable system as no feedline is required.

Right, spurs would not be a problem due to the narrow information
bandwidth required.

I'd use a parallel-programmable DDS part for this application, like the
old Qualcomm chips (which also still seem to have have the lowest spurs
in the business).

I am trying to find software to aid in the creation of circuit board layouts, and to make templates for burning boards. I have been using Electronics Workbench and Circuit Maker, and these are very good modeling tools, but now I need something that will generate the templates for those laser printer sheets for phototransfer to boards. I prefer Mac stuff, but DOS/Win 3.11 is workable as well.

Just saw your post ...

The PC-VFO jr has its BNC connector insulated from the rest of the
PC's case for just that reason. It has a ten pole filter at its output
as well.

We'll be at Dayton with RT Systems, come see us!

There is another alternative --

Chips like the AD9850 have code for phase manipulation. It is
conceivable that with a little DSP you could phase modulate the DDS
chips.

I have information on phase modification of the AD9850 as it applies
to the PC-VFO, an ISA version of the popular Analog Devices DDS chip.

We don't have the phasing information on the web site yet, but it will
be up there eventually. yYou can find what is there at
http://www.bytemark.com/waveguide/pcvfo.htm

Thanks, and good luck on the project.

With new HF appliances going for more than a month's rent I can see why!

> Rat Shack sells a low cost SWR meter[...].

Hmmmm. I'll have to look into that. I hadn't thought of RS in all this except as a source of pieces parts. Thank you.

> As for the tuner, you can indeed get off very
> cheaply at such low power levels. #18 magnet wire wound well spaced on a

I think I know what you mean, but just to be sure, you mean make a twisted bit of the wire sticking out from the surface of the inductor, right? The way I had to make a tap for the toroids in the receiver I wrote about?

> You can use a couple of pieces of single sided pc board for the
> capacitor[...]

That's cool. I hadn't even considered making my own capacitor, but I think it would be fun to make the whole thing from scratch like this. Thanks for the suggestion, I think that's the way I'll go. I suppose that with the schematics for the "L" tuner in the W1FB antenna notebook and your suggestions I should be well on my way to cobbling together just what I need.

Fortunately I can easily snake a short line out to the place where all the other things in the house are grounded. What I probably can't do is pound a few extra ground rods in and connect them up with buried copper wire --- for starters I don't have the pile driver necessary to get such things through the type of soil we have 'round here, and then of course there's the fact that I

don't *own* my house, just rent it.

Well, this is very encouraging. Thanks for taking the time to share this
stuff with me (and, of course, the group).

> Speaking of inverted vees, can you use one at your QTH?

Not likely --- getting the ends up high enough that they won't come near
people would probably require some construction on my part (the neighbor's
kids like to use the wall between our houses as balance beams, so I'd have to
keep the ends a good bit higher still than the top of the wall). And then I'd
still have to construct something to get the center even higher than that.
Probably not an option.

> If you don't have one, you can make a serviceable key out of a drawer knob,
> hacksaw blade, piece of wood, and a dozen wood screws. To get fancy, solder
> relay contacts into drilled-out screw heads for contacts. MFJ recently
> introduced a cheap key too.

Fortunately I have two --- they're actually from Radio Shack, back from the
day when Radio Shack still sold such things. They're not *great* keys, but
they work well enough, and I've got one hooked up to a little code practice
oscillator (another learning experience --- my first home-etched PC board, got
the pattern out of "Now You're Talking").

> Hope this helps, OM. Also you might find useful info at my seb site. URL is in

It is unadvisable to use an automotive battery charger for charging sealed lead acid batteries. The current / voltage could be too high, and your battery could blow up. For a 12V sealed battery, I have read that a constant voltage of about 13.5V will be OK. The current drawn will start off high (perhaps 2-3 amps for a 7 a/h battery), then tail off as the battery charges. Use something like an LC200 or LM317 to supply the 13.5V, and put a 2-3 amp current limit on.

>13.5V, and put a 2-3 amp current limit on.

Or, you might look at the newer constant-current chargers.
What is described above is a constant-POTENTIAL charger with maybe a
current limiter.

A constant C charger can charge a battery in half the time of a CP charger,
all other things being equal The CC will be easier on the battery to boot.

Pricey, tho.

good luck.

All of the equipment listed below is my personal equipmnet!
I have not had the time to get my license! It is about 1.5 years old. All the equipment is new and has manuals. It works well as it has not been run for more than 5-10 hours per piece...I have no time to get my license so I have deceided to sell it all.....

1- Yaesu FT1000D with manuals excellent shape this is the deluxe model , I have many extras with this.
a.) Kam-Kamtronics
b.) Cushcraft 5 Band Vertical Antenna
c.) Elctorinic Keyer-
d.) Yeasu Heavy Duty Rotor
e.) Rotor Wire 100ft.

I also have a FT2400 brand new and a 12 volt power supply

I also have an FT470 with large battery..

Make me a reasonable offer on the above items...

I hae invested over $7000 in all this equipment .

I will not give them away so please don't embarrass me and you by some low stupid offer. I will sell for a fair price for these Unused pieces of equipment. Make me and offer by the piece or all of it.

4837. Full Duplex conversion of GE Exec II radios

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-11 00:00:00 UTC
From: tabourian@compuserve.com
Message-ID: <6j7dc8$v5c$1@nnrp1.dejanews.com>
Source record: 83019
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,alt.ham-radio.mods,rec.radio.amateur.homebrew

I have searched the web for instructions on converting GE Exec II radios to full duplex operation and found several sources, but I am not sure I understand things completely. All of the instructions I have seen talk about how to enable the receiver permanently and how to add an additional RF input for the receiver.

However as I see it, the GE radio has a common RF oscillator for the transmitter and the receiver's first mixer. If the radio transmits some voice band signal, then this signal will get back to the receiver through the 1st mixer.

Am I missing something obvious here?

Tks for every one's help,

Alan+

Looking at the data sheets for the AD9850, I see that the close-in
broadband noise is quite good; however, the non-harmonic spurs close
in to the carrier have me worried. However, using an appropriately
wide filter I think I can remove most of them.

>the AD9850 quotes starting the new frequency in something like 13 clocks from
>the end of setup and immediately is on the new frequency with no smooth
>transition from the olf frequency so there would be sharp steps in frequency
>with fairily strong phase errors, some sort of over sampling to get more
>smalller updates and good filtering may reduce this to a reasonable limit.

With a 100 MHz clock, the 13 clocks are only 130 ns -- quite rapid.
If I ensure that my steps are small -- i.e., I use a fast ADC -- I
should be ok for spurs. IIRC, the 68HC11 ADC is speced for at least
30 or 40 kHz, so I can oversample to my heart's content.

Yeah. Just enough to get a good bite on with an alligator clip. Later on you
can add a 10 pole rotary switch or something like that to clean things up, but
alligator leads allow a lot of experimenting. Make your coil as long as you
like... you can always short out turns with a short jumper, and when you know
the max number of turns you need you can cut out the excess, leaving only a few
extra turns "just in case"
.

>suggestions
>I should be well on my way to cobbling together just what I need.
>
Yeah. You got the idea. There are about four different configurations you can
use, and many variations, that will do better on different band/antenna length
combinations. Start out with the L network in Doug's book and experiment. For
best results make your jumpers short as possible and out of fairly heavy, stiff
wire.

Word of caution.... I don't know about using this type of cap for higher power
levels... I am sure the RF characteristics of different types of PC board vary
widely, and if you heat up your dielectric with a lot of RF, capacitance will
change, maybe enough to necessitate frequent adjustment. If you remove a bit of
copper from around the edges, you shouldn't have any problem with arcing, and I
bet the breakdown voltage is pretty high.

Remember, though, your time is worth something, and if you are hoping to learn something and occupy yoursel with the tuner project for the simple pleasure of experimentation, it is worthwhile. Otherwise, remember MFJ does have that cheap L tuner, which I have used successfully

I am gonna build myself a fancy split-stator rotary cap out of PC board one of these days, just for the technical excercise. The nice thing about thay type is there are no moving contacts... everything solid wired. Probable application is a VFO, so I will then know something about how temperature-sensitive the dielectric constant of PC board substrate is. Hopefully at typical oscillator stage power levels, drift won't be too bad. I might experiment with tapering the shape of the plate for linear tuning across a wider bandwidth.

One more thing... while this is just a tiny bit more technical, you can also homebrew a SWR bridge. I think there is one in the handbook, or maybe W1FB QRP Notebook, or QRP classics. I have not built one, but the circuits I have seen are pretty simple and can be adapted to very low power levels. E-mail me if you need info on that and I will go through the books and see what I have. By the way, both of the QRP books mentioned above belong on your bookshelf if you think you will be doing more homebrewing.

GOOD kits? well, Ramsey has some fairly simple, inexpensive kits. Their URL is
"http://www.ramseyelectronics.com". Another place to see their kits is
"http://www.gatewayelex.com". I have only built stuff for HF, but I have built
some of their stuff for HF QRP and their kits are about the simplest and
easiest you can get. Good intro to kit building... just stuff parts and
solder. Silkscreened boards and decent instructions. The HF stuff has lots of
room on the boards for mods, though I bet the VHF boards are a little busier.
Give them a look. I don't have any experience with their tech support, though
this is because I never had occasion to need it. Everything was there, and
everything worked first time.

Remember lead length become very critical at VHF. Try to get max mechanical
stability and minimum lead length. Clip stuff short, and mount components
tightly against the board.

I would not so that. Too high a current will certainly blow up the
battery. At 13.5V, the current with a totally discharged battery will be
very high and, if the battery reaches 13.5V it is not fully charged yet.
Therefore with 13.5V the battery will never return to it full capacity
(You don't damage it, however, there is no "memory effect").
Give the good ole UC3906 from Unitrode a try. With just a few external
parts You get a very good charger for sealed lead acid batteries.

There URL is http://www.unitrode.com

Excellent, this is exactly the type of practical hint I was hoping to find
here. Thanks again.

Not a problem --- I expect that if I get into this enough to go to higher
powers I'll also be sufficiently committed to it that I'll also be willing to
put more time, effort and money into assembling equipment that's up to the
task.

> Remember, though, your time is worth something, and if you are hoping to learn
> something and occupy yoursel with the tuner project for the simple pleasure of

I'm not much of a ragchewer --- tend to be a very goal-oriented communicator,
in fact --- so for me the process of getting on the air and learning what
makes things tick is probably a bigger part of the fun of this hobby than
actually sitting and making contacts, although I look forward to that, too.

> One more thing... while this is just a tiny bit more technical, you can also
> homebrew a SWR bridge.

Perhaps I've already bitten of as much as I can chew right now, but I might do
this later down the line just for kicks and to see that I can do it. I'll
probably "splurge" and go for the RS bridge.

> By
> the way, both of the QRP books mentioned above belong on your bookshelf if you
> think you will be doing more homebrewing.

Yeah, I *do* need to pick up some specifically QRP/homebrewing books, as until
I committed myself to this particular aspect of the hobby by purchasing the
transceiver kit I had been going for more of the general-purpose stuff, which
is all well and good but not specific enough for what I'm actually going to
be doing in the short term.

I built two Ramsey 2-meter receivers. I couldn't get either to work. I sent them the second, since I had done my best work on that one and when their techs gone done with it, it didn't work any better.

I was told that ten-tec has some good kits. Though you won't save any money building it, you will probably have fun and learn a few things.

I admit, I learned alot building the Ramsey kit but when I was done, I had nothing to show for it other than what I had learned.

What a bummer. I had good luck with the HF stuff, and the price was right. I guess TT is the way to go for 2M.

PS is it didn't work when you got it back, I would send it back again, and demand a refund. Probably won't get it, but at least they will be aware that they could be losing business. Send them a hard-copy of these posts, too. I bet they don't want negative reviews of their products all over the internet.

Alan,
Only the 800 Mhz. Exec II uses the common oscillator. If you want to
make a repeater out of this one you will need two radios.

Actually drill into the tube and directly connect. That will be the only way to guarantee a solution.

Well constructed homebrew linear amplifier using FOUR 811A's.
Complete amp with built in power supply, dual meters, in a table top
size rack. Builder only worked 40 and 75 meters so these are the ony
taps on the bandswitch, other bands could be easily added.

$150 plus UPS

Hi people,

I have now a homebrew test instrument web page.
It is located at:

http://noname.cmpe.ubc.ca/pierre/testequ.htm

It is intended to be a page for people looking for a test instrument to
build.

If you have projects that your would like to see added on it, please email
me so. I will be happy to consider adding it.

There is also a few commercial links for those who want kits or application
informations.

Please follow the link on the page for my email address.

Thanks

Well, when they returned it they didn't say I had messed it up but it
was my first attempt at building anything. I guess I'd like to believe
it was my fault. Maybe I'll take a look at their HF products. Although
I am very interested in pursuing kit building, I have been hesitant to
lay down more money on Ramsey.

Keep in mind that I never expected the reciever to be all that great but
I figured I would at least be able to recieve a reasonably strong
signal. But with the ones I assembled (two attempts at the same kit), I
couldn't lock in on a signal unless I was generating it within very
close distance of the reciever (like from across the room).

4860. Re: Extending the VFO or VCO of a TS-820S

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-11 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.980511221948.23052B-100000@Ocean.CAM.ORG>
Source record: 83042

There are two, maybe three, traditional ways of solving this. One is
to add another crystal to the transverter, but 500KHz higher in frequency,
and when you need the next 500KHz segment, you flip the switch. If the
transverter can handle more than 500KHz if the transceiver does so, and
that seems likely, then the extra crystal and switch should be all you
need.

Another way is to add a crystal to the transceiver so it covers 1MHz at
14MHz. Actually, that may not apply to the 820S, since didn't it not
use 1 crystal per segment but some fancier scheme? The rig itself
probably covers a wider range, but even if it is a matter of adding
another crystal, if the rig doens't have extra band positions then you'd
have to add a small switch to again switch between two crystals in the
transceiver.

The third possibility is to change to 10meters as the band for the
transceiver. Means you will either have to get a new crystal for the
transverter and modify the IF part of it, or get a new transverter. More
complicated or expensive than the two other methods.

Doesn't the 820 have an external VFO input? If so, you could make
an external VFO for it that covers a wider range, though again I'm not
completely familiar with the circuitry of the 820. Or if you want a
single frequency higher up in the band, maybe you could get by with an
external crystal oscillator to feed into the external VFO input, and order
a crystal that would put you on the RTTY frequency.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 17th, 1998
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

Sellers Season Passes are again available until
April 19th for only $50 per space for all 7 meets !!

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)

don't have a cable, but you may not need one. I modified on of the
"commercial" versions of the ft23, slightly different number, the fth-2006,
to be programmed from the keyboard, making it a freely progammable ft23 with
complete 140-200 mhz tx-coverage! yaesu has the missing keys of the ft-23
keypad hidden under a peace of plastic.
Just soldering one jumper #9, and some mechanical stuff to reveal the hidden
keypad keys did the trick!
If you want more information, let me know.

4866. Marine VHF radio conversions ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-11 00:00:00 UTC
From: bry@mnsinc.com
Message-ID: <355645b3.4159883@news.mnsinc.com>
Source record: 83105
Cross-posted to: rec.radio.amateur.boatanchors,rec.radio.amateur.misc,rec.radio.amateur.homebrew

I recently acquired a Standard Horizon Explorer II marine VHF FM
xcvr that I am going to try to modify for 2m on the local repeater.

NOW I find that those rubber covers on
the front-panel are ACTUALLY push buttons for membrane switches and
this baby looks like it is actually synthesized on several channels,
hmmmm. Uses about 5 crystals total in there. Anyone have any
experience moving these jewels or other similar radios onto the 2m
band?

The rocks are marked:

11.155
12.600
"10M15AS"
47.5166
49.1353
(These last two are in their own shielded compartment with trimmers,
varactors, a transistor and a coil/can)

Any idea what frequencies it covers NOW as-is?
Was it somehow programmable?
Anyone have any clues how to move this thing down?

If you don't know, do you have any friends who work with these kinds of things
that MIGHT know?

I do have a manual on the way, so that might help!

Regards

Bry, AF4K / G3XLQ

One of my other responses to this question mentioned the noise at the RF image frequency, which
needs to be suppressed. This is typical of this kind of problem.

I have dealt with your situation several times over the years. The answer, as you know, is to
restrict the L.O. amplifier bandwidth and the RF bandwidth in the proper manner, as much as possible (not always possible).

In an HF receiver that upconverts 1.6 MHz to 109.35 MHz this is very difficult to do and a small
amount of degradation at the low end of the HF band occurs, which is the classic "non-problem".

Bill W0IYH

Voltage regulation is very important. Also, noise performance. NEVER use a 3-terminal 78xx-style regulator to drive a varactor, unless it's in a PLL with a wide-enough loop bandwidth to clean up all the noise that will inevitably result. Best to use a heavily-decoupled, well-bypassed standalone zener, or one of the lower-noise regulator chips out there.

That doesn't even get into the subject of temperature compensation. I don't think varactors are normally specified as having a really good tempco. You usually don't see them used outside of the context of a PLL , AFC circuit, or other frequency-controlling mechanism.

I had to order 'em from Qualcomm, with a hefty minimum order ($150 I
think). The other annoying thing is that you have to use an outboard
DAC. I used the Harris HI5710, IIRC, with good results. Not fun to
wire up by hand. :-(

I'm very interested. I won't be able to set up all of the fancy
features that the cable will let me do, but I'll at least be able to set
the freqs and tones.
If anyone has any info on this, please e-mail me.

Hi!

I need a socket for the 4CX250B, or actually in my case the 8874, but it is the same socket. I've already got the chimney. Send me a note if you've got one you'ld part with for a reasonable amount.

73 & TNX,

Rob Frohne, KL7NA/W7

It's tough to get really good stability out of a varactor, Roger. As mentioned in other posts, poor regulation will make a varactor almost useless. Also, I agree that they are very temperature sensitive. I would not use one at all in a transmitter unless part of a PLL or FLL. They have some usefulness in a RIT control, though, of a reciever, where they represent only a small fraction of the capacitance of an oscillator. Oh yeah... they could, I guess, be used for the fine tuning control of a bandspread tuning scheme of a VFO used for TX. Mainly remember that if the varactor represents a significant portion of the total capacitance, your oscillator will be tough to tame.

If the reason you want to use a varactor is the lack of a suitable capacitor, I suggest building a cap. PC board is an interesting way to go... it combines plat and dielectric in one neat package. QST ran an article on magnetic loop construction, I think in June or July 1994 that featured a split stator cap made out of copper pipe and teflon. For an air variable, all you need is some metal for the plates... air is free and readily available. The only real trick is combining easy adjustment with good mechanical stability.

A lot of kits rely on varactors... Notably Ramsey. Once you get the thing running, you should think about replacing the varactor with an air variable.

If you insist on using a varactor, use a high quality pot, and good regulation. Remember... any noise, RF or AF, in the supply to the varactor will cause what I guess you would call FM modulation of the output....

which gives me an idea of one interesting use of a varactor.... oh I guess it is probably already being done. I was thinking of a varactor as an FM modulator. I have never messed with FM, but it seems like this would be a common use of a varactor.

Hi Gang,

I Need a dial for a HW-7. If you have a scanner and can scan it in that would be great.. if not a fax of the dial plate will suffice. I'm going to make a new one (writing on my old one is worn off for the most part), so I need a reasonably clean original to work from.

Thanks for all the great replies and suggestions/experiences. Very helpful indeed.

It appears that the combined wisdom suggests restraint in using Varactors as the primary frequency determining component of a transceiver. My purpose was to design a unit with ease of duplication as the primary objective, and with air variables becoming more difficult to obtain, the Varactor seemed a viable alternative. Guess not.

Thanks again

Roger KD6CC

According to information I have got, the S2001 used in the TS520 is
a tube made by Toshiba. It is a 6146 like tube but more powerful,
a tube between a 6146A and 6146B. Replace it by a 6146B, not a 6146,
6146A or 6146W.

Tks for the clarification Chris,

I was going crazy trying to figure out how to run in full duplex with the
800 MHz radio and thought that I was missing something obvious given that ll
the of instructions I have seen made it look as if was something simple to
carry out.

Would you recommend some other radio for full duplex conversion that has an
architecture that is more suitable. Note that the performance of the Exec II
was quite good, on TX we got a C/N of 52dB with 0.5% distortion. The receiver
still needs to be tweeked at full quieting the SNR stands at 42dB and THD is
down to 2% for now.

What I came across about 20 years ago was the problem of an elevated broadband noise floor from a synthesiser into the LO port of a mixer with a broadband RF input, and lots of RF signal frequencies. Each incoming signal mixed a portion of the LO noise floor into the IF, by quite normal mixer action. The effect on the apparant RX noise floor was not good.

Ian's sending me a copy of the paper, so I'll get to put my curiosity to rest.

Cheers

Essentially zero. Settling time for a DDS is basically the sample clock
rate.This is of course slowed down by any filtering on the output such as the
tank
circuit. Note that you (effectively) cannot change the frequency faster than
the clock rate feeding the DDS accumulator.

What kind of fidelity do you want? Off hand this does not seem to be the
"ideal" method of performing your FM reception. 20KHz IF implies maybe
3kHz (ham) modulation for 100% levels. So you get the time difference
between 17kHz and 23kHz for your modulation range. How accurately

can you sample that with your HC11 timer? You might get audio with
3 or 4 bits worth of quantization. That will likely sound quite dreadful.

Tom,

AMEN! I too thought this was supposed to be a technical,
DESIGNER/BUILDER's group, not a swap meet.

Don, W6JL

List Of Stamp Applications (L.O.S.A for short)
==============================================

If you have done something (big or small) with the BASIC Stamp
that you are willing to tell others please use the form below and
write a short description, nothing fancy is needed just a simple
explanation. If you have source code to share that's even better but
it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in
the L.O.S.A form on the Web-page...

http://www.hth.com/losa.htm

The latest version of L.O.S.A is going to be posted to the following
mailing lists and news groups, I will update it approx. once a month.

Mailing lists:

BASIC Stamp Mailing List

News groups:

This is today's Daily Blowout Special.

These daily specials will be updated every morning on the "Specials" page of our website

http://www.valuetronics.com

The special for Thursday, May 14 is:

Hewlett Packard 6264B 0 - 20 VDC, 20 Amp Power Supply $195.

In addition, we have approximately 400 slot power supplies manufactured by Acopian, Sola, Lambda and others. Various voltages and current capabilities are available. Prices range from $10. to $100. Call for details.

These instruments will be available for immediate delivery with your credit card purchase. No accessories will be supplied or warranty implied or offered. We do offer an unconditional 5 day right of refusal on these specials.

For more information, please call:

At Hewlett Packard, we did a lot of work trying to temperature
compensate varactors. Motorola not only has the app note you
mention, but several others on the topic. These app notes give
just enough information to make it sound plausible to temperature
compensate a varactor, but no concrete examples of how to do it.
These app notes (and other sources) imply that applying a 2mv/deg
C compensation from a forward biased silicon diode should work.
In practice, with the hyperabrupt AM-radio type diodes we
checked, the compensation required varied from 1/2 of this to
twice this, AND WAS A FUNCTION OF TUNING VOLTAGE. Thus any
compensation scheme would have to account for both temperature
and tuning voltage. I suppose you could have a look up table
for tuning voltage that would apply different amounts of
compensation, but we couldn't stand the complexity. Tempcos
of diodes varied from 100 ppm to 1000 ppm per deg C. On the
other hand, the tempco of inductors is typically in this range,
so a varactor shouldn't degrade an LC VCO significantly, unless
the L-drift was compensated out with TC capacitors, which is
probably the case in any good design.

Disclaimer: it may be the case that lower capacitance diodes of
the FM radio type and/or non-hyperabrupt diodes are more amenable
to compensation. If anyone has tried this, let me know.

>scheme or just a linear scheme (equal value capacitors).

Rather than this, we have proposed a string of varactors in
series with individual fixed swamping caps across each one.
Varactor biases are individually controlled as follows:
at the low frequency end you start with zero DC across all
diodes. Then on one and only one of them (call this one #1),
you ramp the tuning voltage from zero to maximum. To tune
further, you then ramp up the voltage on diode #2, leaving
#1 at max and all others at zero. Extrapolating to the high
frequency setting, all diodes would be at maximum voltage.
You now have continuous tuning without switch transients.
On the other hand, the diodes at zero volts don't contribute
to tempco because then capacitance is so high. The diodes at
maximum voltage don't contribute because there capacitance
is now swamped by the fixed shunt capacitor. Only the varactor
that is "in play" is sensitive, but its sensitivity should be
divided by N, where N is the number of varactors.

>agree that they are very temperature sensitive.

At least for a limited temperature range, temperature compensation
can be added to the tuning voltage. A few years ago, there was a short
article in RadCom about a control voltage divider, which also included
a PTC in the same space as the varactor, thus compensating some of the
temperature drifts.

This is not very effective if some heat is generated inside the
varactor due to losses (momentary forward biasing etc.) in a high
power oscillator circuit.

In the interest of spectral purity, the RF-voltage across the varactor
should be small compared to the control voltage to avoid capacitance
variations (or even forward biasing) during an RF cycle. Back to back
varactors will reduce this capacitance variation during a single cycle
(the capacitance of one varactor will drop while the other is
increasing) or a small fixed capacitor can be put in series with a
large varactor (capacitive voltage divider), but this limits the
tuning range of the circuit.

>If the reason you want to use a varactor is the lack of a suitable capacitor, I
>suggest building a cap. PC board is an interesting way to go... it combines
>plat and dielectric in one neat package.

This is a nice package if you intend to build a humidity meter :-).

Many PC materials will absorb humidity from the air and change the
dielectric constant and thus capacitance. This is why it is not
generally advisable to build high stability VFOs on double sided PCs
due to the variation of stray capacitances with humidity.

>QST ran an article on magnetic loop
>construction, I think in June or July 1994 that featured a split stator cap
>made out of copper pipe and teflon.

I have no idea how the dielectric constant for teflon behaves, but at
least humidity can be a problem with cheaper PC materials.

Hi,

I thought that uploading data to a DDS chip chages only the phase
step, hence the actual DDS output signal steps with the phase
preserved. As long as it all stays bellow cutoff of the antialiasing
filter, there should be no problem with phase.

If the DDS is supposed to be modulated with audio baseband signal, the
resulting sample rate and update rate for the DDS would be just 8kHz,
so there is no problem with DDS update rate.

As for the digital detection of FM, Zilog makes a chip for FSK data
detection with 32kHz deviation (I think it's called Z87000), which is
not exactly what we would want, but I believe that quite a few tricks
from this chip could be tranlated into audio-modulated FM. The Z87000
has a 'one-bit A/D' as they call it, which samples 10.7MHz IF with
sampling rate 8.192 MHz.

Also it is possible to connect a limited IF to a PLD (maybe even
74HCXX) as a period measuring counter (ie. periodically reset). This
would produce a number, which is proportional to input frequency. That
would be FM detection wouldn't it? A trick: the counter can be let to
overflow many times until it is reset and read from. This would be a
'kinda' detection gain/downconversion. The result would be, that for
small changes in the input frequency (like ±4kHz deviation @ the IF
frequency) the output number would change significantly. This output
number can be (formatted and) fed into DAC...

Thinking about it again, such a detector would also be linear, which
could be another bonus, hmmm... I could try to design this detector
(at least on paper)... read my next posting.

Probably you would have to differentiate the modulation signal, before
feeding it into phase modulator. The result would be FM. However, if
you can digitally upload a phase change into the chip, why not upolad
a frequency change instead, and save yourself troubles with processing
of the baseband audio?

>On the other hand, this would mean I would get free PSK for digital
>modes! (Well, free on transmit. I imagine receive would be slightly
>more interesting).

Yep. I don't know AD9850, but AD9830 has a two-bits of direct digital
input to select one of four pre-loaded phase values. So you can do
directly QPSK by feeding two wires with the data to the DDS chip.
A potential problem: this would be PSK (or DPSK) without baseband
pulse shaping, which has very large bandwidth, unless it is fed
through an IF filter.

BTW, the AD9830 has full-scale amplitude control input pin. Has anyone
tried to use this input for AM? I just have this crazy idea that if
you could control both frequency and amplitude of the DDS, this could
be made into a digital SSB modulator (the signal would obviously have
to be cleared up in IF filter before transmitting it).

It certainly does work. This is often how those inexpensive 88-108 MHz
bug
transmitters work. The varactor diode allows you to make a reasonably
stable
and reasonably decent fm transmitter with a few uW output, and
acceptable
audio quality.

Have an Icom IC-u2AT 2 meter handheld. 10 memories, PL, TT pad,
original box, ALL paperwork and newly replaced cells in nicad pack.
Wish to swap even up for a 25 AMP power supply for my HF rig.
Email me if interested.

IMHO, You missed the point. It is not the short range distribution with trucks, which makes the problems, it is the long haul transport. It may be slightly different in the USA, but here in Europe the *big* problems with traffic are due to the fact, that e.g. Finnish trees are sent to Italian sawmills and then to danish furniture companies to be brought back to Spain and sold there. Even worse, cattle is transported all over Europe, just because the slaughterhouse at the other end is slightly cheaper. This is perverse, period.
Independently if such ping-pong transports are reasonable, the overall costs (road maintenance costs, air pollution, public costs due to accidents, traffic jams etc) of trucks would be ways higher, than those of trains. The problem is simply, that not the truck companies (or their customers) have to pay it, but the public (via taxes, etc). This is why the cost comparisons between truck and train transportation are so distorted for the advantage for trucks.

73 Robert

PS: we should move this discussion to a more appropriate NG.

Looking for a used inexpensive memory keyer and an Iambic paddle of some sort. Keyer only needs 4 memories. Mainly looking for something to call CQ with. I know about all the keyer chips and all that available out there that but have no time to build so just looking for something ready to go. Paddle could be an old Brown Bros., Bencher, HamKey or similar but must be Iambic. Condition not important as long as it works good. Email me please.

Subject: ** FLEA at MIT ** Sunday May 17th Cambridge MA
Summary: Buy Sell SWAP Ham Radio Electronics Computers 9AM - 2PM

This coming Sunday...

*** !!!! In our Traditional GARAGE and lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 17th, 1998
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >1000 cars!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

Sellers Season Passes are again available until
April 19th for only $50 per space for all 7 meets !!

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

Just for extra info :-

The Z87000 is the baseband chip designed for the "Z-Phone"
(AKA "A-=Z Phone")
which is a 900MHz ISM band spread spectrum cordless phone.
It's supposed to be used with the Analog Devices AD6190 to
form the complete phone (with added regulator & synth. chip).
The AD6190 does the IF,upconverter & downconverter part.
Of course it may be possible to use the Z87000 for FM -although I
wouldn't
expect much technical support from Zilog outside its normal
purpose.

4925. Help: looking for schematics for DDS VFO in QEX

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-13 00:00:00 UTC
From: "D. J. Wang (KE3ZB)" <ddw2@lehigh.edu>
Message-ID: <3559A41F.E8C@lehigh.edu>
Source record: 82997

I am looking for the schematic for the DDS VFO by WB2V that appeared in QEX in 7/97. I can't find it in any library near me. I would appreciate very much a copy of the schematics. I do not need the article as I have been experimenting with AD9850 and had the DDS part built and tested on my PC. I would be more than happy to pay for the cost and postage.
Thanks and 73.

DJ, KE3ZB

4926. Decoding Frequency Inversion and some split band

A 1496 balanced modulator / de-modulator circuit can
descramble variable frequency inversion.
With a lack of filtering in our DS49 it can decode some
of the split band as well.

Has anyone tried diode (or transistor) switched capacitors using
fixed npo capacitors? This could be either a binary weighted
scheme or just a linear scheme (equal value capacitors).

>Also it is possible to connect a limited IF to a PLD (maybe even
>74HCXX) as a period measuring counter (ie. periodically reset). This

This is what I was planning to do. Original plan was actually to have
a microcontroller time it using on-board timers. I haven't sat down
yet to calculate if it gives enough resolution this way, though.

>Thinking about it again, such a detector would also be linear, which
>could be another bonus, hmmm... I could try to design this detector
>(at least on paper)... read my next posting.

This isn't difficult to do. My desire for using a microcontroller
stems from a dislike of wiring. I might go CPLD if I have to.

Isn't this what the Weaver method is about? SSB generation by
simultaneous amplitude and frequency generation? This might be a
workable idea. Not only that, but it would be relatively easy to add
to my style of FM rig.

4930. Has this become a buy/sell group??

Newsgroup: rec.radio.amateur.homebrew

I noticed it too. As a matter of fact, I was going to post, but then I wondered about one post I saw where someone was looking for a grid-dip meter manual, and someone who builds is more likely to have it than someone who's off talking about the latest rig.

The sad thing is that once it starts happening, it's hard to stop. I hardly read rec.radio.equipment because most of the posts are for buying and selling (or at least that's my impression). The same with boatanchors; there's nothing like seeing a rig from the past in the subject header and expecting some neat comment or question about some cool rig from the old days, only to discover that someone is selling it, and not even bothering to say anything about it. I believe equipment has gotten worse in the past few years. The charter for boatanchors apparently allows for ads, which I think has a tendency to make people believe that ads are okay throughout the hierarchy. And once there are ads for ham equipment, the next thing you see is ads for computers and other electronic equipment.

I don't have much interest in ads here, or in the rest of the hierarchy. Up here in Canada, I'm not likely to buy something across the border, especially from an individual (and Dan's Small Parts has stopped selling to non-Americans, which is unfortunate). So it isn't just that I don't like buy and sell ads, but that virtually all of them can't interest me anyway. Homebrew isn't as bad as some of the others, but it sure would be nice to see conversation about things than ads.

It may be time to make an issue of this in homebrew. But first maybe we should consider the limit of what's acceptable here. Someone who needs a manual for a homebrew related piece of equipment might be okay, someone

who needs a hard to find part might be okay. SOmeone who's got something they want to get rid of might possibly be okay (like if I decided that I didn't need so many old "365 pF broadcast variables" and offered to give some away), but surely not if it's something they are making money from and if they aren't really helping people here but simply trying to find another place to advertise.

Jeffrey Herman in recent months has taken to posting monthly to list of newsgroups in the hierarchy and their purpose, which might help. At least if someone is doing that, people are less able to say "I didn't know".

Ok Rog42, Can you supply schematics on my h.f rx type H.H.E.E. rx1001a ?
The H.H.H.A. stands for Hai Hua Enterprise (China) Corporation..
After many years searching I now suspect it was designed, and probably
built, in Germany by Hagenuk, in about 1987-91... I have the schematics
but would love to have a readable manual.. I don't read chinese.. I look
forward to a positive response !!.

Roger, check out Doug DeMaw's article in QST of (I think)
Feb '88. The article was entitled 'Accessories for your VFO'
and altho the various doublers/triplers are OK my
attention was caught by the tuning method he used for the
VFO. It is a junction FET and he says it surpassed any varactor
he ever used. I have tried it and it works. I asked him why
he never used it again and he replied that he just forgot.

Theoretically you can make any value tuning cap. you need.

I agree. My point was that just maybe something from the operation of
this chip could be aplied elsewhere.

For the FM demodulation using counters etc. I am eating my previous post. I've done some elemantary maths on this: suppose we have ±4kHz deviation and the IF frequency is 100kHz (I know, not a practical frequency). To get a good comms audio, we need 8 bits of resolution (presuming a relatively low sampling rate). To get 8 bits from frequency difference 104kHz-96kHz, it is not possible to use classical frequency counter. It would be better to measure period of this IF. But then the difference of period between lowest and highest IF frequency is just 800ns. To make 256 different discrete values out of 800ns of difference requires 320 MHz clock. Well... it is possible, but why should anyone use ECL logic to demodulate FM? I'd better stick to 'good old discriminator' for a simple RX or if I wanted a perfect

linearity I'd go for quadrature IF and DSP as discussed before.

(Hope I haven't made a complete idiot of myself.)

I wonder if it is possible to change an old CB radio to work
on 50MHz ?
Does anyone has already done it ?
If that is possible, it would be great for me because I can
buy an old CB for a low price and that would be a cheap start
on a new band.
I also have an HF rig, but an independent 6m radio would be better
than a transverter bacause I can be listenning to bouth at the
same time.
Please reply directly to my e-mail address, thanks !

Hi Pedro

Yes, it is quite easy to modify the cb-2-6. See appended note below...

Greetings

Well, what you do is obtain a schematic for the radio you choose to buy
and then look at the sections that are specifically tuned to the
original "use" band (e.g. those circuits that are tuned to 27.xMHz).

All you have to do is change the L's and C's in those circuits to
resonate at 50.1MHz. To do this you can scale the reactances so they are
the same at 50.1MHz as they are at 27MHz. All of the I.F. circuitry
remains UNCHANGED.

For example, if the Xc for a capacitor (1/(2*PI*F*C)) is -J100 ohms at 27 MHz then you need to make -J100 = (1/(2*PI*51.1E6*C) and solve for "C" (change the -J100 to 100 and solve for "C"). Do the same for the inductors Xl = 2*PI*F*L - determine what the reactance is at 27MHz and use an "L" that provides the same reactance at 50.1MHz.

Once you have changed the appropriate input/output RF stages, then all you have to do is determine the NEW crystal frequency required to get 50.1MHz +or- LO = I.F. In many cases, the L.O. freq involves a freq synthesizer output that is mixed to another frequency and THAT freq is the actual L.O. freq.

I was fortunate in that the Sears Roadtalker 40 allowed me to use the original crystal and all that was required was to use the PLL freq + the crystal freq instead of the PLL freq - the crystal freq to generate the final L.O. needed to get on 50.1MHz.

Good luck,

Dick Bingham, W7WKR

Am I missing something obvious, here? I want a duel-ended D.C. supply. from a single phase AC signal. I know I can build a circuit that will do this by connecting two filter capacitors of opposite polarity to a common point and then connecting a half-wave rectifier to the free positive of one of the capacitors, another diode to the free negative leg of the other capacitor and then the AC goes to the free leads of the two diodes.

This does give one a duel-ended DC supply from a two-wire AC feed, but it is not only as badly regulated as any half-wave supply, the ripple is complimentary around the "ground" point made by the junction of the two filters. Is there a combination of diodes and capacitors that will take a two-wire AC input and produce a duel-ended output in which both the positive and negative voltages will have a full-wave ripple?

What I am thinking, here, is that if this is possible, any power transformer whose secondary output voltage is suitable could be used for a duel-ended supply for op-amp circuits and the like. I don't really care about regulation since one would usually put a three-terminal regulator in series, anyway, but the less ripple in the signal to start with, the better.

This question probably seems a bit lazy since the ARRL Handbook probably has every voltage doubler and trippler circuit known to man kind. The fact is that I am almost totally blind so the schematics don't do much good.:-) When I need a duel-ended supply, I have always used a center-tapped transformer so that the output of the bridge forms the two ends of the supply and one needs two filter capacitors going from the center tap to each leg of the bridge. I just got to wondering if it is possible to accomplish the same thing without a center tapped transformer?

Here's something to try...I haven't ever done it, but I think it will
work, and give full-wave ripple on both outputs.

Use a full wave bridge to generate one of the voltages. Let's say it's
the positive one. The AC line goes into that bridge rectifier AC input.
There is a filter capacitor across the output.

Now connect another bridge to another filter capacitor. Connect the
positive output of that second bridge to the negative output of the
first bridge. Now connect two capacitors...electrolytics presumably,
about the size of the filter caps...one from each leg of the input AC to
the AC input of the second bridge. Make sure the negative lead on each
capacitor goes to the second bridge, and the positive goes to the AC
input.

That's two bridge rectifiers and four capacitors, but if you have the
transformer kicking around, it might be worth the effort.

(If anyone tries this and finds it doesn't work, or sees why it won't
work, I'd like to know. It's an off-the-cuff solution, and there are
enough loops in the circuit that I can imagine I'm not seeing some path
for charge or discharge that messes it up... I suspect it may not
behave very well if the current in the minus supply is greater than
the current in the plus supply by very much...)

Yes, the raised apparant noise floor at low tuned frequencies is a classic problem. Guy and myself used a switched xtal filter in the LO path in the 3724A Baseband Analyser, the Racal RA1772 and various other receivers used the same technique long before this.

What I also ran into was not simply the lower skirts of the phase noise characteristic of the LO, but broadband noise from the LO buffer amplifiers. In the BBA, the input signal was white noise of high crest factor covering 0.06-18.6 MHz with a narrow notch for NPR measurement. Because of extremely tight requirements on power measurement flatness, we couldn't use pre-selection. The LO path was very wideband with a sub-ns risetime limiter-driver for the ultra-high level mixer, so the noise bandwidth of the LO path was several hundred MHz. My synth and an 8640 were producing similar results, but an old 608 signal generator seemed to fix the problem when used to drive the final limiter-driver. It turned out that the 608 had a master oscillator - power amplifier structure, where the PA was tuned by extra gangs on the VFO capacitor. Its total noise output power was very low as a result of the narrow bandwidth. I didn't have space to add tracking or banded filters, so I minimised the LO chain noise figure, and ran the oscillator at a high level. This then upset the mixer balance with the even order distortion terms giving an assymmetric waveform of poor mark-space ratio. To fight this, I ran a new VCO at double the wanted frequency, and still at high level, then divided by 2 with an ECL flip flop that drove the limiters. This finally gave the required performance.

As the broadband noise problem is the result of broadband LO content convolved with broadband signal content, then front end selectivity would also have helped had it not been outlawed for other reasons.

I'm looking forward to reading the copy of the paper that Ian's forwarding to me.

Cheers
David GM4ZNX

That's probably the best solution. I appreciate seeing for-sale posts
here for homebrewing-related things like parts and used test equipment.
I am no more interested in wading through 3,000 for-sale posts for
Yaekencom CB... er, *storebought* gear, than the Yaekencom crowd is in
wading through posts from people looking to sell SMA connectors and
signal generators. :)

4964. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-15 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6jgqm7$lt4@news.Hawaii.Edu>
Source record: 82893
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists
==========

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I am in need of one of those simple el Cheapo inline SWR bridges. The rectangular unit with SO-239's on each end and some of them could even be used as a FS meter. They had one knob to set the forward power and then a switch to read reflected. I need one that will go up into the VHF band and as I recall most of these units would read from 3-150mhz. They sold for around $19.95 new. Anyhoo that's what I need. Email me with what you have and a price.

People who are interested in this receiver design and live in Europe
have to realise that the receiver has a tuning resolution of 1 kHz. The
European beacons however are seperated at distances of 0.5 kHz, so it
will be possible to tune to just a part of the beacons. You can check
your particular situation at the Starlink site.

4969. Re: Varactors, Good/Bad?

Before you unload all those BB104's, consider using multiple diodes in a parallel/series arrangement. This spreads the "damage" (RF currents and temperature characteristics) across several diodes instead of just one. With several diodes in the circuit, you should find drift characteristics greatly improved.

I couldn't have put it better myself. Also if I am selling a nice piece
of test gear, that I have maybe invested a bit of tlc in, I'd far rather
it went to a good homebrew ham home than anywhere else. Also there is
the rare occasion when one ham can help another out with a rare spare
part or manual or whatever, as John has done for me, and I have been
able to do for others. This sort of activity is for me just as valuable
as the technical discussions that I enjoy here, but don't often feel
qualified to contribute to.

What is really boring for my 2 cents worth are overpriced pre-dayton
"closeouts" from dealers and anything that includes a url leading to
e-bay, whatever that is.

73 to all and keep on soldering!

I think I saw that QST article, but I don't remember the details. Is he in fact using the FET as a variable resistor in series with a capacitor? There was an article in CQ in the sixties, I have it somewhere around here, on using an FET in such a fashion.

There was also an article in QST for September 1972 (on page 44) entitled "Synthesis of a Varicap" by Edmund S. Cromartie. He describes using a bipolar transistor to "synthesize" a varicap, and no, he isn't using the emitter-base junction reverse biased. He is using the complet transistor as a variable resistance element in series with a capacitor to make the capacitor variable. He claims that it can be used to make the equivalent of any value varicap.

It seems a little bit too neat. If you start putting a high value resistor in series with a capacitor, which is what the transistor is supposed to do, surely the quality is not as good as a capacitor alone, though maybe it is better than some varicaps. The idea, though, is something that probably deserves some experimentation. One always wonders when some "oddball" idea is published why nothing more is heard about it; either the idea is flawed, or people don't want to try something new.

I'm assuming Doug DeMaw's FET was used in a similar capacity. There is a lot more said generally about using FET's as variable resistors that the FET might be a better idea than a bipolar.

Built a little recevier a few years ago with a tuned front end that tracked the LO. The LO used a varactor and I was having trouble getting the frontend to track the way I wanted. Replaced the varactor in the front end with a FET and everything worked great. Not saying that one was better than the other but whatever works use it.

Yes, the resistor would degrade Q, but another fixed cap in parallel would tend to keep it up there, it seems to me. Might be worth a try, on a breadboard type project, just to see how it works.

I still think that I would prefer any voltage tuning scheme be kept in the role of the fine frequency adjustment, where a modest drift would be easily tolerated. This is one place where such methods can pull their weight... dispensing with the cap cuts down on both cost and space for those who want a bandspread tuning arrangement. The TX offset of a transciever VFO comes to mind, too, not to mention certain direct FSK possibilities. The practicality of a voltage determined capacitance depends on how great a percentage of total capacitance is voltage dependant, IMHO. I just would hesitate to use ot for the main tuning of any sort of transmitter or any serious reciever where a stable capacitance is called for.

Message-ID: <6ji6nm$ssl@bgtnsc02.worldnet.att.net>
Source record: 82909

I need the Modification for the Standard C-468A 440 MHZ Handi-Talkie.
That would allow me to open up the Transmit Range from 400 to 474 MHz. I
know there
Is a mod for this radio, I just don't know where to find itï¿½.I've tried
QRZ and OAK but no help.
I own the C-528A and the C-628A Dual-Band Handi-Talkies and have found
the Keypad modifications
For both and have done them. They worked out fine. I'm sure there is a
mod to open up the C-468A.

Anyone who could either pass the Modification along to me, or could tell
me where to find it. I would be in debted to foreverï¿½ï¿½.

Thanks Very Much,

Carl Domanico N2MFW

Look at Horowitz & Hill's _The Art of Electronics_, in their chapter on
power supplies. The discussion on foldback current limiting is rather
short & not rigorous, but should be enough for you to grasp the concept.

Just my $0.02, & good luck -

Going to put up an inverted EL for 160 meters and I am in need of a couple of air variable capacitors of around 300-400pf each. Smaller value ones will also be considered as I can just parallel up what I need for more capacitance. Close spacing should be ok as I will be running under 100 watts. Please email me with what you have and your asking price.

The ZN414 is a complete TRF receiver on a chip. I don't believe it
is still being manufactured (at least, when I tried to get some, no one
had any left).

Joe

From: Murray Kelly <mkelly@powerup.com.au>
Message-ID: <355CED6A.AAC@powerup.com.au>
Source record: 82922

Firstly - it was January '88 (not Feb as I thought) I found
the article in its 'safe' place!

Have a look at the circuit. It's not being used as a variable
capacitor, but more like an attenuator. The size of the shunt
cap determines the range of variablity. Finding the pinch off
point of the fet is the hardest part. I finally used a large pot
and two trimpots in series across a bypassed led in the source for
the gate voltage.

Is it better? I think so and so did deMaw. He measured 10Hz in
the first 10 mins. then nothing. He sid it was better than any VVC
he'd ever tried. Who am I to argue?

Maybe there is no rectification like a diode?

Erm, years ago I received a patent that perhaps I should not have
received.
I observed carefully the output of DBMs as the shaped drive signal went
from +1 to -1. I noticed that the phase amplitude vector took a trip
around
the zero signal point. This was due to feedthrough in the DBM, of course.

I then concluded that this effect could be used in an untra cheap phase
modulator that simply deviated the frequency of a VCO by a known amount
for a known period of time. If the period of time was very small compared

to the modulation rate it would behave like a slightly <chuckle> ratty
phase
shift modulator that had the advantage of being able to add any phase
change you desired for M-ary signaling, say 5 discrete phases. (I have NO

IDEA why anyone would want that particular option. But it is possible.)

If you extend this to a digital PLL and note that you have a very well
defined
discrete time interval, the DDS accumulator clock, you can get literally
any
phase shift on the carrier you want by offsetting the incremental phase
number to the DDS by a discrete amount for one cycle of the accumulator
clock. Who needs any fancy nonsense in the D/A converter? I just want
one that is neat clean with lots of bits and faster than teflon coated
lightning.

Yipe - this idea MIGHT work. It would require some spooky level audio processing. But if I were paid to I bet I could make it work.

Nope - if the audio level is properly scaled is fed to the accumulator
summed to the constant frequency term you get pure FM. You have
to differentiate the audio to get PM. (See my prior rock on this issue.)

Most of the Cheap units dont work to well on VHFInfact most of them only
work "well" on the upper portion of HF (say 20 mhz to 30 mhz)
There are a few Cheap VHF/UHF units out there, the one Radio Shack carried
had
no adjustment for setting callibration on swr All it had was a power sw (5w
15w)
and a SWR/Power Sw. If I remember they were about $30 new

5005. need info for AM BC XMTR w/audio input

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-16 00:00:00 UTC
From: bl784@cleveland.Freenet.Edu
Message-ID: <6jl3tpmhe1@pale-rider.INS.CWRU.Edu>
Source record: 82934

I think what I'd like to do next is build one of those little tiny AM broadcast band transmitters that require no license, using speaker or headphone level audio for modulation input. This will allow me to listen to my HT through the car radio (including the AM-only radio in our clunker), among other things.

The Radio Shack Engineer's mini-notebook has a 2 transistor circuit, using 2N2222's. It looks easy enough to build, but how does it perform? Would it be able to do justice to the nice audio quality out of the HTX-202? (I'm not picky; I just don't want any annoying distortion or significant loss of intelligibility.)

Any comments on the circuit I'm referring to or recommendations for other references would be appreciated.

Hello all
I am clearing out my work shed / shack and have the following
items for disposal of. I have suggested what price I am looking for
but make me an offer and we will haggle

2M Power Amplifier (design by DK1OF) no power supply
With New 4CX250B & SK610 Base & SK606 Chimney.
Unfinished project. The valve and base are worth £25
buyer collects or carriage extra.

PYE M296 for 70cm's conversion.
RX = 441.775 Mhz / TX = 427.275 Mhz
£12 includes P&P

PYE Westminster W15AM on Hi Band (170Mhz)
£4 includes P&P

G3WHO RTTY UNIT with leads and notes
FREE !!! if you collect it

PYE A200 60 Watt Power Amplifier in M1 Band can
be retuned to 6m, 4m or 2m (with copy of HRT article)
£35 includes P&P

DATONG RF Speech clipper (Processor) unit
£12 includes P&P

Unused CM100 PCB making kit complete to make
Professional looking PCB's with UV Bulb and
Photosensitive film.
£12.50 includes P&P

Hewlett Packard 175A Oscilloscope. 50Mhz Y Amp needs attention
but tube and time base believed OK.
This is very BIG and HEAVY so it is FREE BUT you collect it

2 off Hewlett Packard Coax to Wave guide adapters
Model H281a (7.05 - 10.0 Ghz)
£2 each or £3 for both includes P&P

Kit of bits for a 286 pc.
All in one mother board + 1MB Memory with Seagate st351a/x HDD
with manual + drivers
£25 includes P&P

Packard Bell case + PSU £5 if you collect it or carriage extra.

Packard Bell 386sx Motherboard not working (junk box bits)
FREE !!! if you collect it

2off 3 1/2" 1.44mb floppy drives not working (junk box bits)
FREE !!! if you collect

4 IBM compatible keyboards 2 unused and boxed, 2 used - no box
Solid metal construction quite heavy so£3 each if you collect or carriage extra.

MS 5118 Pentium Motherboard with Intel P100 CPU and Heatsink / Fan
supports up to P133 (in manual 40, 50, 60, 66 Mhz bus speeds)
will support 120 Mhz M1 and upto 512 Mb memory with manual + drivers
£40 includes P&P

32Mb Fast Page memory (4 * 8MB simms)
£32 the lot or £9 each simm includes P&P

4 speed IDE CD rom drive
£20 includes P&P

New unused PCI 4MB S3/3D Virge DX SVGA card
£25.00 includes P&P ** NO OFFERS **

I am located in south Manchester - Stockport
so that should give you some idea of distance.
E-mail me with your offer ?

5007. Should I worry abt 127VAC?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-16 00:00:00 UTC
From: lstolz@freenet.columbus.oh.us
Message-ID: <6jlb9b$eqn@login.freenet.columbus.oh.us>
Source record: 82936

Greetings homebrewers,

I recently moved into a new QTH and the "shack" is in the basement near the house AC feed. I consistently measure 127 plus or minus 2 volts at the lines input. Should I be concerned about this? I have both newer solid state equipment running of linear 13.8VDC supplies and hollow-state equipment that was designed to run on 110-117VAC.

I currently use a variac (a.k.a. autotransformer) and run the vintage equipment at 115 volts. I'm not sure whether this is mild paranoia on my part or not. I'd like any comments on this.

Thanks,

--
Lynn Stolz N8AJ --lstolz@freenet.columbus.oh.us

Rec.raio.amateur.equipment is not a sale group either, its charter is
for the discussion of equipment, not buying and selling. (This is
widely ignored, and IMHO has become a big problem there.)
Rec.radio.swap is the only sale group in the rec.radio heirarchy.
Rec.radio.swap has become pretty much overrun with dealers, and I would
support a proposal for rec.radio.amateur.swap or some similar amateur
group.

As for polite email, there seem to be two classes of swap posters in
these groups: 1) those that don't know better, and are glad to follow
the conventions when they find them, and 2) those who know better but
don't care. Unfortunately the second group is much harder to deal with
:-(.

Regards,

Bob W7OV

Yes, I am familiar with this problem. In a production receiver situation where we cannot afford to be
super-meticulous because of cost constraints, I used low cost LC bandpass filters in the LO amplifier
to get a low cost compromise.

In the real world of amateur/commercial/military production receivers we just simply cannot afford to
be as perfectionist as we engineers would like to be. If we don't learn how to compromise in smart
ways we lose our jobs because we price ourselves out of the market.

One example is the S-line, where one of the tuned circuits in the RF slug rack was a tunable BPF
between the LO and the single-ended vacuum tube mixer. This allowed RF gain to be minimized by
reducing the noise figure of the mixer. This was an elegant solution to the LO vacuum tube noise
problem. I was not involved with that particular design.

There's a good bet that the datasheet is on the GEC Plessy website.
http://www.gpsemi.com or something like that. Getting to the
obselete parts is tricky. First you find a seach page and enter the
part number. This gives a search failed page which has a link to
the obselete parts database search, and then you search again.

If the URL is wrong, try one of the Chipdir sites.

Radio Shack sells a ready made gadget that does this without soldering in the car radio. It's a tape cassette like device (all car radios these days have cassette players built in don't they) attached to a wire and a speaker jack. You plug the cassette into your car radio and the jack into your ham radio and viola...stereo QRM.

On the high end of the complexity spectrum, the new (June 1998) issue of
Electronics Now magazine has a synthesized AM broadcast transmitter from
North Country Radio (Graf and Sheets). Seems they have a web site, now.

Harmonics city. That circuit is more suited for beginning electronics enthusiasts to experiment with than for regular use. Proper output filtering is definitely called for. Also the audio quality will be rather poor with no compression at all, and who knows what kind of pre emphasis you will have with a 2N2222 in that simple circuit. On the plus side, it will only cost a buck or so to build.

But why not just use a mag mount antenna and a car lighter plug, and listen to your HT stright from your HT? Or, if you just want to use your car radio's audio and your car speakers, poke around in the radio and find a good spot in your audio chain and solder a short jumper in there, run it out of the case to a phone plug, and stick that into your headphone jack. Start with the audio gain on both units all the way down. By the way, try not to drive a STEREO amp by just one channel... sometimes they "go away" if you abuse them that way for too long. An ordinary AM set is no problem tho.

Well, I think the main thing to worry about is your tube filaments. That's a significant overvoltage, and you were maybe wise to use the autotransformer. If you still have the manuals, look and see if there are taps on the filament XFMR to compensate for higher line voltages. If you don't have the books, find an Old-Timer who knows of such things to check it out. You may as well do it the right way if you are gonna be running off that higher voltage. Save your autotransformer unless it gets cold in your shack and you just need the extra heat. Your tube heaters probably are 6.3 volts or something like that. Find out, and measure the voltage at the socket.... CAREFULLY! Hook up your test leads before powering up, and power down before removing them. You might have several hundred volts to the plate of some of your tubes. Anyway, an out of spec filament voltage indicates that you need to do something if you want your tubes to last.

I think you might find your tube pin-outs in the ARRL handbook, by the way, if you can't find them anywhere else. Hooking up your meter to a 400V plate might make all the smoke leak out of your meter, so don't just stab around in there until you think you got it.

When I lived in the states (Philadelphia area) the line voltage
was always about 128 volts.

The solid state equipment should not be affected if the 13.8 volt supplies
are regulated.

While it may be paranoia, IMHO it's justified. The difference is enough
(1.11 times) to affect tube fillements. While I doubt that audio or home
radio type tubes would be affected, high power transmitting tubes might.

Geoff.

From: denton sprague <denton@oregontrail.net>
Message-ID: <355EF98C.DBBABB6F@oregontrail.net>
Source record: 82950

Hi...I have a 35 amp continous duty "13.8" VDC power supply I have constructed and modified over the years...
Last little modification was to add an automotive 40 amp circut breaker (to be replaced with a 30 amp) on the B+ output side, as I had a short to ground that fried all of my pass transistors (6-2N3055's). Before this, I did not have current limiting.
I current use an LM-317T with a pair of transistors "wrapped around" the regulator to boost up the regulators current handling ability.
My questions: Are the automotive circut breakers sufficiently fast enough to avoid pass transistor frying in short to ground conditions? Or should I be looking at a different regulator circut that has current foldback or current limiting.
I have a lot of the ARRL handbooks laying around, but seems to me that the regulatory circurtry is a little involved for what they do...
Thanks...

5025. Audio feedback with FR-146?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-17 00:00:00 UTC

I built the Ramsey FR-146 2 meter receiver, and it works great (with headphones)!

As I was adjusting the 3.5 turn coil, I noticed that it was noisy. When I touched the plastic casing, it almost sounded like there was a microphone somewhere close. I dismissed it.

But, when I installed a small speaker inside the enclosure, I get constant feedback. WHERE IS THE MICROPHONE!!!!

Does anyone know what is acting as a microphone? What can I do to shield it?

Thanks in advance,

Dave Frascone

Actually, if there a cassette player in the radio, then an adapter can be plugged into speaker jack on the radio running to a coil which feeds the heads in the Cassette deck, and gives all the audio one could need. I used to use a similar technique for an HF rig. 73 Magazine had an article, Radioshack sells one allegedly for feeding a CD Player into the Cassette portion for $19.95 although building one for less is possible, and similar products can be found for less in mail order catalogs. Also a working 8 ohm or so earphone placed where the tape meets the head in a cassette player and glued, and then a set of wire run out the side of the Cassette shell that is on the side of the casssette that goes last into the player and terminated in a plug to match the receiver usually works, although the fidelity is not always great. Considering the usual passband of most amateur gear, it's more than adequate, and certainly suffices for copying cw or a normal QSO.

Hi Lynn,
If you want to do the job without using your variac, you could
hook up a 12.6v transformer in a series bucking configuration.
This would subtract 12.6 from your 127 leaving 114.4v.
Of course you need to calculate the proper current rating
for your transformer, but I'm sure it will be smaller than the
variac.-- BTW-- if you could find some old car battery
chargers (at a garbage I mean garage sale)and remove the
transformer, they could handle a pretty good size load.

Are there any known major fit problems in this kit? Specifically, is there a problem with the mounting holes in the "Center Block Assy"? The prob here is: when I mount the center block, the dit and dah paddle gap adjust screws do not line up with their respective paddle stop set screws. Possibly the base is not correctly drilled on mine---seems I need: bigger holes or slots so I can adj the position of the center block, a bigger hammer, better bifocals, or more brain power.
Suggestions?
Tnx....bob.....

rcrusoe@aol.com (RCrusoe) writes:
[a whole bunch of useful suggestions to spark my imagination and make me get into the homebrew and cobble-it-together-out-of-sealingwax-and-bailing-wire mooed]

Well, after getting so much help from this group I thought it should be the first place for me to blurt out my success story as a way of showing appreciation and to encourage others to take the plunge.

If you recall my last chapeter, I'd ordered a Wilderness Radio SST for $85 and was worrying about antenna tuners and antennae.

The radio arrived last monday at 4pm, and was completely put together by 10:30pm --- a testimony to the simplicity of the kit (and since this is a *homebrew* group and not a kit building group I'll leave it there).

Well, I did build the quick and dirty antenna tuner that was suggested, a bunch of turns of magnet wire (couldn't find #18, had to use #22) around a toilet paper roll for an inductor, two pieces of spare PC board stock as a cap, arranged in an L configuration, and yes, it did indeed enable me to tune the SWR down (measured with a $20 Radio Shack meter) to below 1.5:1 into a roughly 1/4 wave piece of #14 copper antenna wire. But since I had a lousy ground system, and no clear way of getting a *short* ground strap through the wall and into the back yard, it appeared that no power was actually getting out of the house (I'd tried an *indoor* "random" wire).

Tonight I decided to try something different. Three sections of 10' PVC pipe, 20' of RG-58 and a PL-259, and some more of that copper antenna wire. A length of 1" dowel rod, and some 3/8" gutter spikes. Get the gutter spikes secured into the end of the dowel rod, drive them into the ground outside, put the PVC over the dowel, and viola, dipole at 10' above the deck. Not great for 30 meters, but I'd give it a whirl.

Sat down at a folding table outside, hooked the itsy bitsy rig up to the dipole, a straight key and a power supply and listened for a while. Then I decided to dive in head first with both feet in my mouth, so I found a clear frequency, pounded out QRL?, waited a while and then called CQ a couple times.

And before I could bat an eyelash a station in South Dakota boomed in and became my first-ever HF contact, and while I was only putting out 2 watts or thereabouts, he said I was RST 559 into his QTH (I'm in Albuquerque, NM). And the nice gentleman, K0WIU, was kind enough to slow down his code without being asked (well, I did say "PSE BEAR WITH ME, U R MY FIRST CONTACT") so I could copy him without any trouble at all. I made lots of spelling errors, had to use a bunch of "oopses," and had to stop frequently to remember how to spell

really hard words like "just," "back," and of course "albuquerque." But what a blast!

And now I'm hooked. Pity it started raining just as we signed off, or I'd still be outside on the patio, getting strange looks from my neighbors, improving my code copy and grinning from ear to ear.

Thanks for the hints and kinks, now it's time to put together a battery pack so I can take the whole kit and kaboodle on that backpacking trip I'm taking next weekend...

I haven't seen the specific circuit you mention, but the general idea works great, I've tried it. I built a little crystal oscillator (was lucky enough to find a 1600KHz crystal at a hamfest -- and to live well outside the coverage area of any station anywhere near that frequency!) using a single 2N2222.

For modulation, I got a 500-to-8 ohm transformer at Radio Shack. The same kind they used to use in transistor radios before the power op-amp came along. Hooked the 500-ohm winding in series with the 9VDC to the oscillator, and wired a 1/8" phone plug to the 8-ohm winding. Just plugged it into the earphone jack of a cassette player, using the player's audio amp as a modulator.

Fantastic audio quality -- better than any broadcast station. The audio *level* is a bit low (since I wasn't using any compression & had to keep the modulation percentage well below 100%) but since the carrier was strong enough, I didn't have any noise problems. And zero drift, more than I can say for several small FM transmitters I've tried over the years.

Well as Montgomery Burns would say... "EXCELLENT!" Quite a memorable first contact, Tom. Sure is gratifying to see your early success. You are justified if you feel just a bit proud of getting so many loose ends together at once for your HF debut. I thoroughly enjoyed your post... Thanks for sharing it. Only problem is, I'm afraid your enthusiasm is infectuous. My fingers are getting that itch again that can only be cured by holding a well-tinned soldering iron with constructional intent!

Alan,

A simple approach is to use Siemens BTS711L1 or BTS721L1 (1.9A and 2.7A)
These are PROFET's in quad packages (4 to a package).
I use them and they are bullet proof. They are designed for motor drive (and other things too) and
can be driven directly from logic signals. They have built in charge pumps for gate drive in high
side switching applications. Wire the chip as a bridge circuit and the job is done.
Using these devices is so easy it is almost trivial.

The chips are available from Farnell for development uses.
Part numbers 743-380 and 743-392 at $13.32 and $18.90
For data go to http://www.siemens.com

regards,
John

First of all, please remember that a low voltage high current power
supply can be quite dangerous and you can get severe burns if a
unlimited short circuit current flows in conductors not designed for
such currents (not to mention the fire hazard). In the unlucky
situation in with both the series pass transistors and the rectifiers
burn into a short circuit, the short circuit current is only limited
by the transformer copper and core losses and hopefully this will blow
the primary fuse (I hope that you have one).

Running 35 A through six 2N3055 is quite a lot. While this transistor
is specified for 15 A maximum collector current, the current gain is
specified only at 4 A and the current gain drops quite rapidly above
this level. Thus, nine or ten 2N3055 should be used for 35 A output
current.

I do not know about automotive circuit breakers, but mains circuit
breakers are require to withstand the nominal current indefinitely and
twice that for several minutes. If two or three times the nominal
current is flowing (with no extra current limiting) for several tens
of seconds in the short circuit situation, it is no wonder that your
transistors get fried quite quickly.With 200-300 W dissipation per
transistor, it does not take many seconds to fry the transistors.

>I current use an LM-317T with a pair of transistors "wrapped around" the
>regulator to boost up the regulators current handling ability.

The 317 can deliver only 1.5 A of base current to the series pass
transistors. Multiply this by the current gain of the series pass
transistors to get the maximum allowed output current. With high power
transistors with current gain defined at 15 A, you might even get 30 A
out of two good quality power transistors. Two 2N3055 are definitely
not going to deliver more than about 15 A with 1.5 A drive.

>My questions: Are the automotive circut breakers sufficiently fast
>enough to avoid pass transistor frying in short to ground conditions? Or
>should I be looking at a different regulator circut that has current

>foldback or current limiting.

With electronic current limiting (to say 35 A) will just prevent the current from increasing to extremely high values. A 30-40 A circuit breaker in this situation can not distinguish between 35 A of nominal current and 35 A of limited short circuit current, so it is not much of use (apart for being an extra protection in case the electronic current liming fails).

With 16 V capacitor voltage and 14 V output voltage and 35 A output current the normal power dissipation in the series pass transistors are (16-14)*35 = 70 W spread among several transistors. However, in the short circuit current limited case, the output voltage is 0 V and the power dissipation is (16-0)*35 = 560 W, which is very much even when spread among several transistors. Unless you very quickly manually remove the short circuit or turn off the power supply, the transistors are going to be fried within a minute unless forced air or water cooling is used. An automotive circuit breaker is not going to be tripped in this case due to the electronic current limiting.

While the nominal power dissipation for the 2N3055 is 117 W, this can only be achieved if the case is kept at 25 C, which is practical only with water cooling. Even with very large heatsink or forced air cooling, it is advisable to keep the design power dissipation below 50 W/transistor.

While simple current limiting may be enough for attended operation, it clearly is not acceptable for unattended operation. For unattended operation, the short circuit power dissipation should remain reasonable. If the fold back circuit limits the short circuit current to say 5 A, the power dissipation will then be (16-0)*5= 80 W, which only slightly deviates from the nominal power dissipation.

Better yet, the current limiting circuit should completely disconnect the power supply, if the current limit is operating, since this is usually an indication of a fault somewhere, which should be inspected, before reapplying power with a manual reset at the power supply.

>I have a lot of the ARRL handbooks laying around, but seems to me that
>the regulatory circurtry is a little involved for what they do...

With the good old 723 voltage regulator, it is quite easy to construct foldback current limitation. The drawback is that the voltage drop and power dissipation is going to be increased in the current sensing resistors. The 723 can be sensitive to RF, so if you have high signal levels in your shack, it is a good idea to put an RFC at the output terminal.

Low voltage high current power supplies can be dangerous, so it is advisable to do it "right". With low voltage, low current power supplies you usually can get away with some small mistakes, but this is not necessary so for any high current (and/or high voltage) power supplies.

I recently purchased an HBR-16 receiver. Part of the package was serveral pieces of correspondence between the builder, Ted Crosby, W6TC and Alex Stewart. They were quite candid with each other, interesting reading. I was wondering if any one else has correspondence from HBR builders and Crosby and Stewart?

I am also looking for parts to complete another HBR. I need Miller parts 1461-BS, 2102 (these two items are capacitors), IF transformers 1709 (4 each), BFO transformer 1711. Triad power transformer T-12A and a couple C9-X filter chokes. Also a Lafayette 99-2513 S-meter.

My question must have been vague. I was wondering why the junction capacitance of a JFET would be any more or less stable than the junction capacitance of a diode.

Also what you describe sounds like using a JFET (or varactor) to change the load on the oscillator, thus pulling the frequency. If one were to take out the JFET and replace it with a varactor of equivalent range, do you think the stability would be any different?

Source record: 82822

I'm trying to use this circuit board making method which works by copying your board artwork to a transparency using a Xerox or similar copying machine. You then heat transfer ("iron-on") the pattern to your board.

I've tried it on a couple of machines and the pattern on the transparency came out smeared on both. (About 80 to 90% OK but too much smearing to correct by hand.)

Any solutions? These seem to be pretty fast machines; maybe that's the problem.

Does a Laserjet printer use the same process (toner fused to copy)? Could I just print directly to my transparency using the Laserjet?

Lynn:
The high voltage won't affect you power supply or probably
any other of you equipment. What it will do is greatly shorten the
life of the light bulbs in your house. Contact the power company in
your area, the usually can adjust a transformer tap and bring the voltage
back in line.

Schottky diodes are the way to go for cricital applications. Practically all
packaged diode double balanced mixer modules use Schottky. I have used 1N914s,
and they "work" if properly matched, and frankly I don't have the test gear
needed to really put them through their paces, but I like the little
Mini-Circuits SBL-1 module. It contains the transformers and everything, with
50 ohm input/output. This module is very convenient, and is well regarded in
the homebrewing community.

Source record: 82827

Hello All,

Can anyone give me advice on alignment and use of this 5-100MHz bridge? With nothing connected I can obtain zero 'mhos' balance but not zero 'pF'. A complete balance IS obtained at about 100pF minimum. There are five screw terminals on top - two are at an angle above the transmission line assembly. I wonder if there is something missing from my unit that would account for the capacitive imbalance? There are two internal capacitor trimmers - I hesitate to touch these until I know what they both do.

I'm keen to use the bridge for some antenna work.

Any help would be appreciated, regards, Bob Edwards G4BBY, Chippenham, Wiltshire, UK.

If it must be passive and broad band and relatively efficient (low
loss), I suggest that you use a switch and not a combiner.

Would you describe the application?

If you tap around the oscilator (with a plastic object ie a pen)
lightly you will find the couple of parts that are vibrating. I am
putting my money on the 3.5 turn coil. Try to make the leads shorter
and/or use wax as it was suggested on another post to dampen the
vibration. You might have noticed in some receivers the coils have
some sponge-like material and was all over the place; that's what it
is used for; mechanical stability.

One bunch of old time Ohmite Z chokes.

1 each Z-28, 20-60MHz, 1.75 inches long, yellow, unused
6 each Z-0, 2M, 1.75 inches long, red, unused

1 each Z-?, 5uH center-tapped, 1.75 inches long, black, unused
Think this one is for 2M push-pull as in 829B or 4CX250Bs.

1 each Z-50, 6M, 1 inch long, red, unused
1 each Z-235, 1.25M, 7/8 inches long, yellow, unused
1 each Z-144, 2M, 7/8 inches long, green, used

I think the big ones were rated 1 Amp, little ones .5 Amp
but check old catalogs.

All 11 for $20 pickup, $25 pp us.
Please guys, don't get me in the onezee, twozee mail order biz.
It costs me an hour, a gallon of gas and 3-4 bux just to send
a needle to Hoboken...
I just want to get these to some VHF/UHF fan who can use them.

I honestly do not know why I am replying to this....but here it goes....

Our founding fathers actually expected the government to probably get out of control, and wanted the people to have the rights to gain it back, "The right to bear Arms". The right to bear arms is "necessary to the security of a free state". The problem being you may find this to be a "free state", but many of us are finding it increasingly restrictive.

As a matter of note, most world dictatorships and monarchies start by relieving the public of there weapons so they may seize and maintain power and control. Its in the history books, and in the news.

I do not own a weapon, have no immediate desire to purchase one, but find that most anti gun ownership lobbies to lack a logical basis, usually spouting gun related deaths without mentioning that if a gun was not available a pick axe might have been used to the same affect.

Regards

Christopher Cox

PS Sorry for the inconvenience as am replying to a post that Mr. Fisher has linked to many newsgroups.

Any older varactors (with a data sheet) you have on hand, let me know.
I'm interested in doing some experimenting.

I'd like to give etching a board a try. I've built a Tuna Tin 2 via the Norcal board and would like to do one homebrew.

Can anyone point me towards a pattern for the TT2 or perhaps for another simple transmitter?

Thanks... Karl - W5QJ

Ok... Rail... Now this is really smart. Only rail transport?
Picture this:
A railroad line, running to every Winn-Dixie, Bi-Lo, Wal-Mart,
SAM's, shopping mall, ad nauseum.
Don't forget fueling the trains.
And of course, don't forget the total pain-in-the-ass of waiting
at a RailRoad crossing EVERYWHERE YOU GO, and the poor guy who
becomes a statistic thinking he can beat the train through the
crossing.
SURE, we could totally eliminate the trucking system and replace
it with rails...
REALLY bright.

Source record: 82844
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Hi all!
I'm working on a project that requires a very small 2m FM
receiver. The smallest I have seen so far are in commercial
WALKMAN\radio units, but I really need it smaller. If possible
I'd like to get it down to about 1 x 1 inches. Multiple boards can
be stacked on top of each other but I'd rather it not be any
larger than 1 inch thick. I'm trying to make a pager that goes
off when it receives a DTMF tone (or series) and sets off a
beeper and/or a flashing LED. The pager unit itself consists of
a PCB about 1 x 1 that uses a 567 tone decoder and a 555 timer.
The real problem is the receiver. I don't know if it can be
built small enough. Does anyone have any ideas or know how I
could modify the receiver of an old motorola commercial pager
to work? Thanks for your help! Please post responses to
rec.radio.amateur.homebrew or mail them to aporr@coil.com.
Thanks a million!

No, nor does Bank Robbery constitute a major number in violent crime related deaths.

> No kids ever killed teachers and students with a pick ax.

Really...I find that surprising, world wide? How about Rwanda?...BUT if you do your homework you will find world wide that violent crime related deaths is not attributed to gun ownership...indeed just the opposite was found to be true. A fellow at OSU finished his findings last your if you are interested. It is gruesome.....

I would not expect the circuit breaker to trip quick enough.

I built a similar supply, 317 based, and followed the diagram given in "The Art of Electronics" in the power supply chapter examples. I believe this circuit is also in the National data book for the 317. It is pretty simple, only requiring an op-amp and a handful of other components. (Another advantage is it is adjustable, it does not have a fixed trip point.)

> I have a lot of the ARRL handbooks laying around, but seems to me that
> the regulatory circurtry is a little involved for what they do...
> Thanks...

Yep. I have a bunch as well. Unfortunately, they don't have a great deal of detail, although the later ones to have some information on foldback current limiting.

My recommendation would be to go to a good bookstore and pick up a copy of "The Art of Electronics". I have found it to be a very valuable source of information. The only drawback is the price, about USD $60 if I recall. (I bought mine a several years back.) Although for this circuit, you could simply go over to National's web site and download the 317 data sheet with the circuit diagram.

~~~W4ABC Writes...

Read those words and choke Burt. Knowing that you come from an overprotective (overbearing) anti-gun state like Massachusetts, I have no doubts who does the thinking for you Burt. I was born there, and I'm not looking back.

My brother still lives there, and he tells me that there is a proviso that states that if an intruder enters your place of dwelling, that you must first attempt to flee. Talk about "BULLSHIT." Here in Florida, you are already eating the wrong end of Mr. Mossberg's M590A1. It is not there to kill, but to "STOP" the unlawfull individual's entry into my home. Sometimes they don't live to draw their own gun though Burt!

Since we are talking about the rights of the "Individual," "Groups," "People," let's talk about one well known individual in history, that disarmed his country so that all would be safe from the ravages of the "gun." His name was non other than "Adolf Hitler."

Burt if you are serious about being "taken seriously," then may I suggest a couple of books that you may wish to peruse.

"More Guns - Less Crime" by John R. Lott Jr. The University of Chicago Press

"The Second Amendment Primer" by Les Adams Palladium Press

Let me tell you the story about this caveman that beat his wife on the head with a gun...

I see that you're selling an M296 yet in the next message your asking for a
9k6 compatible radio.

It would seem you already have the stuff you need!

Spend a few of those beer token from the other kit on a pair of rocks.

Well, I recently got a wake up call. Tuesday night I was arrested in Newington CT outside of the ARRL headquarters. Apparently, I was almost naked and assaulted David Sumner as he left work for the day. I say apparently because I was very, very drunk and remember nothing but throwing my clothes out the window on I-95. In addition to assault and indecent exposure, I face DUI charges and illegal possession of a firearm. God only knows what I intended to do, but there was a pawnshop receipt from a Boston area pawnshop, and a box of rifle shells. I want to thank all you guys for not letting me get by with my trolling and relentless ham bashing. I realize now that I have led a frustrating, boring life, and with the help of the treatment program my school's EAP has sent me to, I hope to pick up the pieces of my life someday. It all went wrong after high school, when I was no longer president of the ham radio club at South Dennis High, and couldn't really cut it in college. Ham radio was my life, I had no balance, so eventually, when I realized how empty my life had become, I lashed out. I am truly sorry if I have caused anyone here any pain or anger.

Burt

The latest item to be added to Novice Notes Online is a two-way Morse practice system. Included is a full article with several diagrams.

The item is the latest constructional project to be added to the growing list of circuits now available through Peter Parker's Project Page.

Also added are several new links on topics such as ARDF, homebrewing and more.

The URL for Novice Notes Online is

5079. Re: Homebrew power supply current limiting?

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-19 00:00:00 UTC
From: Marty Duplissey <mduplissey@lsbs.com>
Message-ID: <6jt0om$3vs$1@usenet11.supernews.com>
Source record: 82771

I would measure the current flowing through the lm317 and use another lm317
for current limiting through the regulating one. Most of the data books have
the circuit diagram on hooking up the lm317 as a current limiter. I'm in the
proccess of building just such a monster using 2sd797's instead of 2n3055's
They came already mounted on the heatsink on the Computer UPS I stole the
case transformer etc from.

I have a Heathkit HW-12 80M SSB tranceiver that works just fine -- except : it switches from receive to transmit after a minute or so, "all by itself". That is it switches to transmit when the VOX is not calling for transmit. It is like something leaks in the VOX circuit. Any one familiar with this problem and can make a suggestion for debugging the hardware ? K2YJP LHYost@aol.com Thanks.

>> Amendment II
>>
>> A well regulated militia, being necessary to the security of a free
>state,
>> the right of the people to keep and bear arms, shall not be infringed.
>>
>> It says NOTHING about INDIVIDUALS, N O T H I N G .

Since when don't you acknowledge that "People" = "Individuals" ?
Just who do you think "the people" are? certainly NOT the established
government. When in the Declaration of Independence it states ... WE
THE PEOPLE ... who do you think that is? It is US, the citizens.

From: Murray Kelly <mkelly@powerup.com.au>
Message-ID: <3560ED4E.445E@powerup.com.au>
Source record: 82849

OK - my answer must have been vague, too :-)

The gate resitor is not bypassed. This prompted my question that maybe
it as acting as a variable resistor. The diode of the junction
is not itself shunting the RF. Therefore, its capacitance seems
to be unimportant. If you look at the FET as 2 junctions
from source to drain, then maybe .....

If that was true, tho, a bipolar should work as well. I never
tried it.

The values I used were determined mathematically. L:C for top
frequency then the amount of parallel C to bring it down to the
lowest frequency. That calculated value did the trick, which seems
to me to indicate the capacitance and not the load, as such, was
the frequency varying component.

Jake Brodsky wrote:
> My question must have been vague. I was wondering why the junction
> capacitance of a JFET would be any more or less stable than the
> junction capacitance of a diode.

v.s. I don't believe the junction capcitance is the determining
factor. The frequency varying capacitor is in series with the
fet. The fet turns it on/off more/less. Capacitors have reactance
but I never think of their variable 'resistance' as varying he
load on an oscillating tank and thereby changing the frequency of
oscillation. Another way of looking at them, I suppose.

> Also what you describe sounds like using a JFET (or varactor) to
> change the load on the oscillator, thus pulling the frequency. If one
> were to take out the JFET and replace it with a varactor of equivalent
> range, do you think the stability would be any different?
> Jake Brodsky, AB3A

It seems so, in my hands.

5091. quality BNC patch cables F/S

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-19 00:00:00 UTC
From: <>
Message-ID: <6jr0e4pud1@news1.abac.com>
Source record: 82853

I have available a quantity of quality BNC patch cables. They are made of Thermax RGU179 coax, crimp BNC connectors, and have heatshrink strain reliefs. The BNC connectors have gold center pins. Cables are marked with a tag that has a "house" part number, and a tag that says "engineering use only". These cables are in good shape; they appear not to be used- and they are obviously of good quality construction. However, they are offered on an as-is basis.

10 cables for $20., UPS ground shipping from San Diego to most locations $5.

To reserve cables and get ordering info,

email to

rdavis@abac.com

(do not reply to the address in this message header)

average'Average' means being run-of-the-mill,
mediocre, insignificant, an also-ran, a non-entity.
'Average' is the top of the bottom, the best of the worst,
the bottom of the top, the worst of the best.Which of these is you?
Being 'average' is the lazy person's cop out,
it's lacking the guts to take a stand in life;it's living by default.
Being 'average' is to take up space for no purpose,
to take the trip through life but never to pay the fare.
Being 'average' is to pass one's life away with time,
rather than to pass one's time away with life.
To be 'average' is to be forgotten once you pass from this life.
The successful are remembered for their contributions,
the failures are remembered because they tried,
but the'average', the silent majority, is just forgotten."

You can take any dictator. This is certainly the most extreme (and most undemocratic) way of a government to control "its" people.
You should be careful, however, to compare the government's monopole of using force, as it is used in (quite democratic) countries like Switzerland, Germany or Great Britain with a dictatorship like Nazi-Germany. It is rather arrogant to condemn any idea other than Your own one. The American system of justice may be one way to go, but there are other democratic systems in the world, which realize the same idea of a free society in a slightly different manner.
BTW, do You have a reference for what You mentioned above? I have never heard, that Hitler ever seriously hided his true intentions, why he wanted to disarm the "man on the street" (except in his and Goebbels propaganda, which You won't count much on, do You?). I'd be really interested, where You have that idea from.

Regards

Robert

5099. More crazy ideas...

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-20 00:00:00 UTC
From: rexstout@uswest.net
Message-ID: <rexstout-2005980103100001@dialupg126.ptld.uswest.net>
Source record: 82779

I think I think too much... ;-)
OK, first on the list is a quick 6m conversion. I cracked open a "Space Patrol" walkie-talkie I got from Radio Shack last year, and it's pretty simple. Swap a crystal(mine has a 49.86Mc in it), tweak it a little, put a small power amp on it,feed it into a dipole... Anyways, just a funny thought. Would 50.4Mc be a good freq for FM? I don't want to send it up to the 52/53Mc range for fear of the need to swap more parts... Although I may try getting up to the normal FM simplex freq on a later experiment. And of course a squelch circuit is a very important addition to these things, even if it stays on 49MHz...

Second stupid idea. I have a dozen WY-99GT terminals taking up space in the basement, so I dragged one up to my lab in the attic and attacked it. The main logice board is now partially salvaged(8088-2, 8041 and two 27512 EPROMs, but I can't seem to get this board to unsolder very easily), and am left with a useless CRT. I don't suppose there is any way to turn this thing into an oscope? I suppose with modifications for the larger CRT, I could use older cicuits for portable oscopes that used very small 1-1.5" CRT's, but they were only 500KHz-1MHz scopes. Are there any more modern circuits I can toss into the case, doesn't have to be fast but 5-10MHz would be nice. And of course, the faster the better...

Now for a few other things... I salvaged some parts from the reel-to-reel tape drive from IBM minicomputer, and it had a small board with two CMOS IC's, and maybe a half dozen resistors, caps and an inductor on it. It is labeled as a Voltage Controlled Oscillator. How exactly do those things work? I looked around in the ARRL handbook(several editions), as well as some other books, but couldn't find anything. Is there any use for this odd little PCB, other than parts?
Oh yes, I almost forgot. Among the craziness, I began thinking of building a nice little radio for myself. Probably a 2m FM rig, and maybe some other projects for a CW(or maybe MCW) or SSB later in other versions. Not some dinky little things with 1/2W output and confusing(or at least to me) dial tuning. I was thinking more commercial level... Min 10W output, maybe asa much as 50W. Digital freq display, direct freq entry on a nice little keypad, DTMF and PL tone encoders... And maybe even a built-in power/SWR meter. The guys I was talking to at the time of this inspiration thought I was crazy. Especially since I haven't really built much other than small antennas so far... But just HOW crazy AM I?? I know it's possible, but I'm not going to start if it's going to make me insane in the process... Pointers to info on doing this project would be appreciated.

Alright, I think that's it for now... 73's and I'm looking forward to the responces to this message...

Yup. Knives, and simply threats, are also highly popular, and
effective.

>No kids ever killed teachers and students with a pick ax.

Don't count on it. Here, in Rochester, the weapon of choice to kill
teachers and students is also the knife. Unfortunately, it has proven to
be a highly effective one.

For Sale: Communications and related books

Intro Circuit Analysis, by Boylestad 2nd edition-1972
Electrical and Electronic Fundamentals $ 10

Telecommunications, by Hioki 2nd edition - 1995
Excellent, up to date book $ 12

Fiber Optics , by Hoss 2nd edition $ 5

Electronic Communication Systems, by Kennedy 1977
Classic Communications text book $ 10

Electronics for Scientists, by Malmstadt 1962
Excellent reference for the "older stuff"
Used by Heath in some of their courses $ 18

Modern Electronic Communications, by Miller 5th edition - 1996
Great book for the technician, $ 18

Modern Electronic Communications, by Miller 4th edition
As above, older edition $ 12

Differential Equations, by Morris 4th edition -1964 $ 12

Contemporary Data Communications, by Ramos 1994
Technician Level $ 12

Calculus, by Sherwood 3rd edition -1954 $ 12

Technicians Guide to Fiber Optics, by Sterling $ 8

Intro to Modern Mathematics, by Vance 1963 $ 12

Trigonometry with Tables, by Welchons 1960 $ 8

Prices do not include shipping from NE Ohio.

Actually, the National Socialists, though they were far from Second Amendment-type purists, considerably loosened gun restrictions in Germany compared to the previous "Social Democratic" regime. Just compare the 1928 and 1938 laws. (A book has been published which prints the two laws side by side, so they can be easily compared. It's called _Gun Control in Germany, 1928-1945_ and I think Noontide Press in California, among others, has it. It is also for sale at a lot of gun shows.)

Guns were widely owned by private individuals in Germany from 1933-1945, but were required to be turned in to the Communist and other Allied authorities when the occupation governments were set up after the war.

....

I'm not necessarily disagreeing with you re the Swiss and the Americans, but this "democracy" bit is a poor use of the language.

Switzerland and the United States are republics, and have constitutions for a very important reason -- to protect us from the tyranny of the majority; to secure rights that no majority and no legislature can ever take away, no matter how large or passionate the majority is that wants to do so.

Democracy and tyranny are perfectly compatible. It's called mob rule.

Democracy and freedom are mutually exclusive.

I'll take freedom.

Cheers,

Kevin, WB4AIO.

>. . .

I'm not familiar with the terminal type, but one thing to check is the type of deflection system used for the CRT. If you see a magnetic yoke (lots of turns of wires on a ferrite core) around the neck of the tube, you won't be able to easily make a conventional analog CRT. The magnetic yoke is generally used for raster scan, like a T.V., not vector scan, as done with an analog scope. Digitizing scopes use a raster scan display. This is possible because all the data are stored in digital form and can be sent to the CRT in the proper order for display.

A decent analog scope is pretty complex. It needs a linear, triggered timebase, clean vertical amplifiers, and if you want to see what triggered it, a compensated delay line for the vertical signal. The faster the scope, the more difficult it is to do all these things, and the larger the CRT, the more capacitance you have to drive. (The deflection structures in higher-speed CRTs are actually specially designed transmission lines.) It should, however, be easy to make a simple XY scope for looking at Lissajous figures at audio frequencies and similar tasks, provided that the CRT uses electrostatic deflection (no CRT yoke).

Well, there are others here who know a lot more than I but unless I'm mistaken the TV channel around the 6m band transmits the audio on a 4.5MHz sub-carrier, so a completely new detection circuit would have to be made. In my very humble opinion, you'd be better off using the existing components and building a reciever for 6m rather than try and convert the tuner.

The argument is about the definition of people.
I believe it to be we the people as in every citizen in the United
States os America. Therefore Congress can not pass a law which
infringes on ME as a person covered in the group called people.
So in that context the second amendment bars congress from passing
ant gun law.
How did a debate about guns get into the newsgroup?

You could use the TV tuner as a converter and use a 'quality'
sortwave receiver tuned to the TV's I.F. as the back-end.
For the bandpass you're interested in, tune the SW rcvr to
select the signals you wish --- not the TV tuner.
But -- then there's the need to adequately shield the "IF"
to prevent leak-in of 'normal' shortwave signals.
And -- just how stable is the L.O. in the TV tuner?
Und so weiter...

Curtis .. N5HDQ .. http://wf.quik.com/n5hdq
I can't think of anything witty to say here.
Oh well, no one is perfect.

What do you know about what is scheduled to happen
in November as regards the Brady Law?

Do you remember that back in 93 when it was being
debated it was presented as a 5 year Law that would
prevent handguns from falling into the hands of
Criminals and fade into the sunset in 98 ...???

Not so. It was in the original language that five
years after enactment that the word handgun be
replaced with firearm, and an instant background
check be conducted for the purchase of a FIREARM.

It seems that the law has been modified by various
agencies (is this legal in itself) to the point
that a National Firearm registration program will

be attempted. This does not pertain to new guns alone as if you take in a gun for repair a background check is supposed to be ran on you.

How do you feel about a law that was ruled, at least in part, as un-constitutional being beefed up to suit Clinton and his gun grabbing Corps..?

There is a bill (H.R. 2721) going around on Capitol Hill now that would kill Brady cxompletely should it become law. It needs help now as there are only four signed on to it now.

If you want to help you could contact your people in Washington urging them to sponsor H.R. 2721.

Hi there,
Well in looking over the 6m Band plan. I noticed that there is
a AM calling freq (was it 50.04?, anyway it is there) I have been
planing to start with something for that range myself, AM being
simplier than SSB myself.

The short answer is both yes and no.

As Tim points out, the audio is on a subcarrier. I remember seeing
something about this years ago, and they used a trick of adding
an oscillator in the right place to act like the picture carrier
so the audio IF works properly; in effect adding a conversiion stage
to the tv set.

That applies to North American TV sets; I'm not sure of the standards
for European televsion.

But other than that, a North American TV set might even cover the six
meter band since channel 2 is starts at 54MHz where the six meter band
leaves off. The fine tuning might get it down into six meters, or at most
it would take a tiny returning.

But again I don't know the frequency range of the channels in Europe,
so it may require more work.

A problem with all of the above is that it's a wideband system. The audio
subcarrier in North America uses something like a 75KHz deviation so
the recovered audio on a narroband FM signal would be weak at best. Even
if the European standard uses AM for audio, I can't imagine it being a
narrow IF strip.

And since TV signals are wideband, stability would be a problem with
narrowband signals. The old sets used a free running oscillator in
the front end. They'd drift through a narrow signal very rapidly. More
recent TV sets use a phase-locked loop; since they tune in wide steps
(6MHz channel spacing in North America) that wouldn't be too useful.

So even if the thing can be tuned to six meters, it won't do a good job of
receiving modern signals.

A scheme that people suggested years ago was taking the front end tuner
out of a tv set and using it as a converter. The front ends were probably
the equivalent to the front end of the average non-DX receiver, and the

tuneable IF meant that you could easily pick the frequency range for the receiver that followed it.

More recent front ends probably are better, though I don't know how well they deal with weak signals or even strong signals. Considering the rise of cable, at least here in North America, I might imagine they lack sensitivy.

The recent front ends are also voltage tuned, meaning you can tune anything within the range of the tuner, rather than just in steps. Since many of them have an output from the oscillator, prescaled in many cases, one could add a PLL for stability, though the prescaler might be a problem in getting small steps.

Instead of using the tuner with an existing receiver, you could add a narrow band IF strip (provided you stabilize the oscillator in the front end) and tunr it into a wideband receiver. I watch for tv sets being thrown out, and if they are digitally tuned I'll open them up and salvage the front end tuner. I've never done anything with them, but eventually I do plan to use one of them to make a wideband VHF/UHF receiver. I don't intend it to be high performance, but it's always useful to have something that can operate over a wide range.

Message-ID: <3564410F.315C@swbell.net>
Source record: 82709

at 13.8v dc,30Mhz test frequency, the MRF458 has 13 dB gain,3watts in gives you 80 watts out, case style 211-11.

at 13.8v dc,30Mhz test frequency, the MRF454 has 12 dB gain,5watts in gives you 80watts out, case style 211-11

from the comparison (taken from the rf parts catalog) i would say that the 458 ha a higher Av then the 454 other than that they should swap out ok. i will try and find my motorola book on rf transistor specs for more detailed comparison hope this helps you

You should be able to "fix" this by adding a short delay between chars.
I'm not that familiar with stamp basic, but in assembler, generating N82
would
be trivial.

5122. FS: Electronics and Communications books

I have the following books (all in excellent to new condition) available:

Practical Electronics Troubleshooting by Perozzo
Good information on troubleshooting all sorts of electrical
and electronic devices $ 15

Understanding Data Communications by Friend
The title says it all! $ 15

Understanding Communications Systems by Cannon
This one covers all sorts of communication systems -- not
just the data communications like the one above. $ 15

An Introduction to Fiber Optics by Shotwell
Not in great depth, but an easy to understand book $ 15

Introduction to Electronics and Electronic Shop Practices
by Worden - Mainly a "Shop Techniques" book, with lots
of reference charts, etc., but some theory included $ 18

Digital Electronics by Uffenbeck - Technician Level text
Covers from number systems to shift registers to Programmable
devices to interfacing $ 25

Electricity - Principles and Applications by Fowler
Part of McGraw Hill's "Basic Skills in Electricity and Electronics"
group of texts. Mainly theory, in easy to understand
explanations. $ 20

Electrical Measurements by Smith & Wiedenbeck
Classical measurements book - Engineer level $ 15

Principles of Electronic Communications by Mandl
Includes modulation, amplifiers, noise, transmission lines,
antennas, etc. $ 18

I also have

Exploring Handbook - 1958 - close to new condition $ 20

Handbook for Patrol Leaders - 1950 copyright - 1959 printing $ 18

1986 American Red Cross "Expect the Unexpected" $ 2

If you would like more information about any book, please e-mail to
W8EK@usa.net. All books are in good shape.

Prices do not include shipping from NE Ohio.

Assuming this is for Solid State Amps;

If you are transforming 50 to 5.5 Ohms then you need 16.7 Ohm
line for 1/4 Wave Transformer. 25 Ohm coax will get you to 12.5 Ohms.

There's commercial 25, 15, 10 Ohm minature semi-rigid hardline
I've used in the past. 15 Ohms will get you 4.5 Ohms. This is
single ended of course. For Balanced Transformers then 25 Ohm should
get you 6.25 Ohms each side to ground.

Some sites are:

http://www.webcom.com/cyberrep/prectube/prectube.html

Looking to build my first HF amplifier, and I am leaning towards a design with 4 2sc2879's.The other appealing alternative is a tube amp with 811A's. Apart from the fact that for 80 bucks I can get a matched quad set of either, the 811A giving about 800W PEP, and the 2sc2879s about 500, what are the advantages to each design, for the novice amp builder in particular. My 'design' so far is limited to the choice of amplifying devices. QST and the ARRL handbook offer a number of HF tube designs, and VHF bricks, but where might I find some solid state designs? I really wish the ARRL would put a web-based QST/QEX article search engine on-line. Thanks.

You can make 25 ohm coax by paralleling two pieces of 50 ohm coax. Small 50 ohm semi-rigid coax is fairly common and could be used for this. Although a number of companies make semi-rigid coax in lower impedances, it's uncommon and I don't know where you could get a small quantity.

Varicaps are not as good as solid well built air dilectric variable
capacitors.
Here are 2 reasons.
Temperature coefficient.
Varicaps approx +300ppm/deg/C
Q at 100MHz for UHF type 2000.
Performance further degraded by the means of getting DC to the varicap
ie resistor damping and noise.
The above can be improved / optimised by operating the varicap at the
high voltage end both Q and Tc improve.
Use UHF varicaps paralleled up at HF some are low cost so it does not
cost too much.
Isolate vaticap DC bias /RF with a combination of reactance and
resistance .
Take care over the noise level from the tuning voltage use potentiometer
from low noise voltage reference.
Finally dilute the varicap with as much stable C as possible.

Douglas Dwyer Frequency Precision Ltd. I design/advise on Xtal osc TCXO OCXO
SAWc etc . Still have some surplus state of the art 16.384 MHz OCXOs (nearly
Rubidium performance) $90

I think what you are looking for is just a regular L network. The idea seems to be to present a low impedence at the ground terminal of the regular antenna tuner. MFJ sells a device they claim works great for this, and I think it is fairly cheap. Basically you are making a too-long ground run or a random length radial behave like a 1/4 wave radial. Maybe if you have an old tuner laying around you could try using that.

The Handbook gives a pretty fair treatment of RF basics.

The way a reciever allows CW reception is that the carrier, which is all there is to the signal, is converted to a lower frequency. The RF frquency, that is the actual frequency of the signal on the air, is much too high to be in the audio range. The conversion process reduces the frequency down to the audio range. From there it is simply treated as an audio signal. CW transmission and reception are indeed radio in its simplest form, and understanding of the mode gives you a good foundation for understanding other modes.

AM is easily implemented by modulating the plate of a tube or the collector of a bipolar transistor. The audio signal is impressed on the collector, and the RF signal, the carrier, is applied to the base. without modulation the transistor will simply be an amplifier with the signal output at the collector. Since the audio signal is present, the level of the audio signal either adds to or subtracts from the level of the output, and so now the output contains the audio information. This is a simple AM modulator.

Detection of the AM signal off the air is accomplished in many different ways. The same reciever you used for CW will work for AM after a fashion. The conversion is not RF carrier to an audible frequency, though... The carrier frequency is essentially reduced to zero Hertz, and so the carrier is not audible. The sidebands are the actual audio information impressed on the carrier, and they will be present in the audio output in their original audio frequency range. A diode detector is actually simpler for AM reception though... the diode only allows a current to flow one way through it, and so the upper parts of the RF cycle get through. The peaks essentially form the audio envelope. The resulting audio signal is amplified and led to a speaker. These are just two ways to demodulate an AM signal.

FM is done differently. The audio information is used not to modify the Amplitude (strength) of the carrier, but the instantaneous frequency of it. One wimple way to do this is by letting the audio signal change the Inductance or capacitance seen by a RF oscillator. Many schemes are used to achieve this, including reverse biasing a diode or other device in the tuned circuit of an osckillator. A thourough treatment of FM should probably wait until you have mastered CW and AM. Ditto with Sideband.

There are as many kinds of variable frequency oscillators as there are types of vehicles on the highway. Basically, a typical oscillator is an amplifier in which some of the output signal is redirected back to the input. This signal goes through a tuned circuit that allows a certain frequency to pass more easily than others, and so this feedback is of that frequency. It is amplified and re-digested continuously, while other frequencies basically die a quick death. The amount of this feedback must be enough to overcome losses in the circuit and keep the device humming along A quatz crystal in the feedback

circuit is sort of a tuned circuit. A capacitor and an inductor together also form such a circuit, and the classic way to change the frequency of an oscillator is to change the value of either inductance or capacitance, most often with a variable capacitor. Changing the value changes the frequency most easily passed through the circuit and returned to the input, thereby changing the output.

The means of converting signals to another frequency are somewhat beyond the scope of a usenet post, so I won't go into that. It can also be a hard subject to grasp, and I was building mixers long before I pretended to even remotely understand why they worked. The concept of sidebands is also hard to put a finger on for some people. The more fundamentally you examine the operation of a mixer or the phenomena of sidebands, the more confusing it gets until finally for most of us the lightbulb goes off.

Might I suggest that you get a copy of "Now You're Talking!", published by the ARRL and available at Rat Shack? This is the study guide for the Novice and Technician class license exam elements. Use the crawl first/walk later approach, and get your ham ticket. You will mostly be learning very basic principles of electricity and electronics as you study for the rather simple exam. Once you have a firm handle on that, work on upgrading your license. Study in depth rather than just studying the test questions. The bite at a time approach is a relatively painless way to learn the fundamentals of radio electronics. Talk with other hams, visit their shacks, read the ham mags, and soak up stuff on an ongoing basis. GET the ARRL Handbook, and read a chapter a week or so. When you finish, read it again. The Handbook is IMHO the best all-around reference and training manual for the radio art.

Once you start seeing the light, try building a few simple projects. Try to figure out exactly what the circuit does, and how you can change the behavior of it. A simple one transistor CW transmitter is a good place to start. It will cost you about $20 tops to put something together, assuming you own no parts but have a soldering iron, etc. A companion receiver is a good next step. Next thing you know, you are on the air with a completely homebuilt station. MODIFY stuff to suit your exact needs. Add stuff on to improve operation. You can start with a very simple transmitter with 5 or 6 parts and end up with a multiband, multimode transciever.

Above all, keep it fun. Don't let it become an intimidating chore to study... rather keep projects in mind that are incentives to learning new techniques or more sophisticated design principles. Think about the device you want to build this month, not the complete legal limit station you probably will never get around to building. Before you know it, you will be doing some pretty amazing things with knowledge you acquired just messing around with a hobby.

The best (text)book on electronics I have ever seen is _Microelectronic_Circuits_, by Sedra and Smith. Expensive -- 'bout $100 IIRC -- but well worth it. It's currently in the 4th edition. The only part of it I don't like is their chapter on power output stages.

Also recommended are _Art_of_Electronics_ by Horowitz and Hill, the ARRL _Handbooks_ (sort of OK references), and _Solid-State_Design_, also published by the ARRL.

Hams support the Oregon shooting? Funny, I'm a ham, and a gun owner, but I don't recall showing support for it. Matter of fact, I think it's disgusting. To broadly label such thing against a GROUP is pretty hard to do and be able to back it up with facts.

My weapons are kept where I can get to them, but then I don't have kids to worry about. IN MOST CASES, parents ARE (SHOULD BE) responsible for the actions of their children. But, in this case if he killed them too, then you can't hold the parents other than for that which they may have failed to do PRIOR TO their own demise. Like the day before, when he took the gun to school and was thrown out, but hey, they may have been dead already too, at that time.

It is PEOPLE who kill, NOT THE GUNS. Just like when a drunk takes a car and kills. It isn't the car. Cars, guns, knives, baseball bats, bricks, pipes, etc. Any weapon of choice, does NOT have a mind nor a consciounce to make the choice.

But it is WRONG to say OPENLY that a GROUP supports such a thing. You are speaking for me as well by that statement, and I sir, NEVER support such a dastardly deed. Let me speak for myself, PLEASE.

Hi , I'm looking to Buy either a Homebrew or commercially made Two Meter (144 MHz) and or a (440 MHz) Tube Amplifier. It must be able to amplify an FM Signal and of course have a built in or external power supply. The Power Rating would have to be in the 500 Watt Class. Designed to run off a 120 volt AC Line. I don't want any junk ! I want a good solid reliable amplifier. I will be using it with a Kenwood 144/440 MHz.FM Mobile Radio, so the drive requirements would have to match the exciterï¿½.144 MHz. 5 Watts, 10 Watts or 50 Wattsï¿½.440 MHz.. 5 Watts, 10 Watts or 35 Wattsï¿½.I intend on using it for long distance simplex operationï¿½..

Thank You
Very Much,

Carl Domanico N2MFW

I saw that. Interesting, but I want to build something broadband, not just for 40M, as this design is. As you say, the amp is keyed by OOK-ing the power supply, an arrangment I'd rather avoid. Still, it is a lot of bang for the buck.

5170. TOROID SOFTWARE AND CORES

Newsgroup: rec.radio.amateur.homebrew
Date: 1998-05-22 00:00:00 UTC
From: toroids@aol.com
Message-ID: <1998052204210200.AAA21560@ladder01.news.aol.com>
Source record: 82727

WE SUPPLY WOUND CORES FOR SPECIFIC POWER AND RF NEEDS .
WEALSO SELL TOROID SOFTWARE

We have written a Toroid software package for use DC to 300 MHz. Many Years of research has gone into error corrections for the low perm cores , 200 & 360 degree coverage as well as SRF for series and shunt coils. Much of this has come about as a request from Micrometals. The pin point accuracy allows us to add a custom core feature for custom shaped cores, stacking cores side by side and machining custom phenolic cores from plastic, teflon, wood, ect...
Down load a demo or just view the software main screen at our web
http://members.aol.com/Toroids/johnindx.htm
or click below
Best Regards John Bellora @ B&E Engineering Software

Attention Fellow Computer Enthusiast:

***** C O M P U T E R S O F T W A R E F R A U D A L E R T *****

%%%%%%%%%% C O R E L S O F T W A R E E X P O S E D %%%%%%%%%%

HERE'S A TIP TO HELP YOU AVOID SOME FUTURE GRIEF (AND SAVE SOME OF YOUR HARD EARNED MONEY)

PC World Magazine, in their February issue made reference to a particular software title as

'THE SOFTWARE FROM HELL'.

I've never used the product they were referring to, so I can't comment about it.

Nevertheless, if PC World had been talking about software from

COREL CORPORATION (Word Perfect, etc), it would have been MOST APPROPRIATE.

COREL SOFTWARE PRODUCTS, IN ALL THEIR FORMS, TRULY DESERVE THE TITLE

****** S O F T W A R E F R O M H E L L ******

because they are buggy (and dysfunctional) beyond belief. Corel products make Microsoft look like the knight in shinning armor, even including Windoze 95.

YOU CAN'T READ INFO LIKE THIS IN THE COMPUTER MAGAZINES BECAUSE COREL SPENDS FAR TOO MUCH MONEY VIA ADVERTISING REVENUE WITH ALL THE COMPUTER PUBLICATIONS, AND THEY DON'T DARE EXPOSE ONE OF THEIR BIGGEST ADVERTISERS, FOR REASONS WHICH SHOULD BE OBVIOUS. THEREFORE, WE CAN ONLY HOPE TO PASS THE WORD VIA NEWS GROUPS AND SIMILAR OUTLETS.

Corel Corporation, a Canadian firm, based in Ottawa, Ontario, has zero regard and zero respect for their customers, and is probably the best example of why Ziff Davis (publishers of dozens of computer magazines, both on the PC and Mac platforms), are now calling for a mandatory (and legally binding) 30, 60 or 90 day software money back guarantee.

Using data from Corel's own website, the following is more than sufficient proof to demonstrate the dysfunctional character of Corel's Word Perfect product:

THE FOLLOWING BUG LIST IS TAKEN FROM COREL'S WORLD WIDE WEBSITE:
==========

ftp://ftp.corel.com/pub/WordPerfect/wpmac/-WPMac ftp Index.html

(scroll way down, almost to the bottom)

What follows is the list of bug fixes initiated by Corel in an attempt to repair their cockroach infested product known as Word Perfect, version 3.5, which can easily be construed as a clear admission of bugs which existed with version 3.5 as shipped to customers on CD ROM. What makes this issue all the more criminal is the fact that Corel refused to inform customers who sent in their warranty registration cards that bug fixes had been released for this product. Corel Corporation refused to send warranty/registered customers the patches on floppy disk, and if this was too expensive, Corel Corporation even refused to send registered customers a postcard informing their customers where they could find the patches on the Internet. Customers were simply left to struggle with a totally dysfunctional product. And customers like myself who finally figured out Corel Word Perfect could NOT be made to function properly, and who first requested assistance, were ignored, and who later requested a refund, were also ignored.

TO THIS DAY, 17 MONTHS AFTER THE PURCHASE OF THE DYSFUNCTION AND COCKROACH INFESTED COREL WORD PERFECT PROGRAM, THIS COMPANY CONTINUES TO IGNORE ALL INTERNET E-MAIL MESSGES AND ALL UNITED STATES AND CANADIAN POSTAL SERVICES LETTERS.

==========

Corel Document ID: 10339

The information in this document applies to:
WordPerfect 3.5 for Macintosh

This Updater works with all versions of Corel WordPerfect 3.5. Including: Novell WordPerfect 3.5, Corel WordPerfect 3.5.1, Corel WordPerfect 3.5.2 and Corel WordPerfect in the CorelDraw Suite.

The Corel WordPerfect 3.5.3 patch replaces all previous patches for WordPerfect 3.5, including the Corel WordPerfect 3.5.2 patch shipped in October of 1996.

Fixes in 3.5.3 patch
==========

- Conversions should now function normally under System 7.6.
- A bug was fixed that repairs some display problems.
- Sporadic warnings that the common library could not be found will no longer occur.

Fixes in 3.5.2 patch
==========

- Text Selection now works properly.

- The Print Envelope feature will print addresses in the correct position on the LaserWriter 8.4 printer driver.

- Deleting to the right at the beginning of a line will no longer cause the cursor to reposition incorrectly in the text above.

- Deleting just before a Style no longer causes the cursor to reposition incorrectly and delete text within the Style.

- Editing a document in ?Show Codes? no longer causes the cursor to reposition incorrectly.

- Headers/Footers with text attributes (bold, underline...) are no longer affected by text attributes that cross a page break.

- Deleting addresses in the Print Envelope delivery or return address window now functions properly.

- The German Dictionary no longer stops and marks incorrect every word that contains a ? (esset).

- The French Dictionary on a Power Macintosh no longer stops and marks incorrect words that contain a ? (acute).

- Delivery Point of a bar code is no longer automatically calculated.

- Import of tables from various document types has been improved.

- The title of the ?WP6.x Export? now reads ?WP6.x,7.x Export? in both the patched and resale CD product from Corel.

- HTML export now saves Corel WordPerfect graphics or .wpg formatted images as JPEG?s.

Fixes in 3.5.1 patch
====================

- Editing some long blocks of Japanese characters will not crash the computer.

- Screen display is faster after scrolling through large documents or tables, or making editing changes.

- Captions can now be positioned above a graphic or text box.

- Return and delivery addresses in Print Envelope will now allow 255 characters (including line breaks).

- Dictionaries are now listed under the Dictionary menu instead of the Check menu.

- Ruler Bar display problems with PCI Power Macintosh computers have been fixed.

- WP 6.x and WP 7.x conversions can now be canceled.

- While working in subdocuments?such as headers or footnotes on black and white screens, Corel WordPerfect does not quit unexpectedly when clicking in the ruler area of the subdocument.

- Zip codes beginning with zero which did not have extended zip code digits now function properly in the Print Envelope feature.

- Font menus in Preferences and Print Envelopes now work properly on small monitors.

- Cleared tabs will no longer unexpectedly reappear on the ruler.

- Hyperlink copy and paste are now working.

- Cell Protection now disables the deletion of the contents of a cell.

- The bottom border of a table which crosses a page break is now visible.

- Patterns in a cell will no longer disappear when performing a Split or Join.

- Joining with the first cell of a table now functions properly.

- Row selection of tables in a text box is now available.

- Scroll bar does not stick when scrolling.

- Corel WordPerfect will use the Language Resource file designed for your system if present, or default to English (USA).

- Page Setup is now enabled in the Print Envelope feature (this allows the selection of paper sizes and envelope trays).

- Changing QuickCorrect preferences with no documents open will no longer crash the computer.

- Tables and Page Borders now work together.

- The PowerTalk Mailer can exceed 4096 characters.

- In the new Corel WordPerfect 3.5 CD-ROM, Norton Utilities will no longer report an error in the WordPerfect Installer Read Me. This fix is not available in the patch, but if you use Norton Utilities, we suggest you delete the WordPerfect Installer Read Me since it is not required for proper operation of the software.

- Corel WordPerfect Dictionaries and QuickCorrect word lists will no longer be replaced during installation.

==========

Postscript:

The above represents the bug list for Word Perfect 3.5, as I purchased this product, these revelations coming directly from Corel's website. Considering all these problems, it is little wonder that Ziff Davis Publishers are now suggesting we have a SOFTWARE LEMON LAW to protect computer consumers from future issues of this sort of software larceny.

If the reader will examine the websites of PC Week, PC World, and a few other leading PC-platform computer magazines, he will discover that Corel's Word Perfect, Suite 8 (the latest offering from Corel) is likewise

full of bugs. Don't take my word for it--- check it out for yourself.

MORAL OF STORY::::

SAVE YOUR MONEY--- DO NOT BUY ANYTHING WITH ���COREL��� ON THE LABEL, WHETHER IT BE FOR IBM COMPATIBLES OR THE MACINTOSH !!!

What I did to get 15 ohm coax was to order "16 AWG teflon shielded
wire" from Alpha Wire and Cable as shown in the Newark catalog.
I.E.: 16 gauge hook up with with thin (.010) teflon tape insulation
with tinned braid over it and a jacket over that. Really
coax but not sold as such.

I selected wire with very thin insulation between the conductor and
the shield, but a large wire size, to get low Zo. You could order
smaller gauges in the same series to get somewhat higher impedances.
This wire made very nice coax up to 100 MHz in a 300 W amplifer.

One again guns are responsible for student deaths. If the gun did not exist do you think this kid would have gone to the cafeteria and tossed knives? The ham radio connection is that most hams have no guts and they are more likely to have a gun to "buy" their guts.

Please visit my World Wide Web Site, you have never seen a page like it. You will see:

1. A naked chic
2. An actual picture of Burt on the throne.
3. The writings of me and others on ham radio, hear a typical ham contact.
4. The warm side of K1OIK, hear me speak, see me with famous people.
5. A test for your SVGA monitor
6. Pictures of me and my family.
7. A Nazi connection in ham radio?
8. See now the future of ham radio.

Media is focusing too much on one violence.

As media broadcasts the violence, the situation becomes even worse
(you hear this and this is going on and so forth and some people think
it is normal to do such thing). Anyway... please don't focus too
much... you will make it even worse...

There was a research done regarding to the TV / movie etc. There was
a small community with no TV (ie. no freq to receive and no cables
either). After setting up the TV system (either freq or cable), the
crime rate raised suddenly by 2 times or more.

As for guns, I believe that the parents are responsible.
If the parents are responsible for their kids, the kids will be
responsible for themselves. It's natural. And amazing enough...
most kids (who get focused on medias) get guns from their family...

There are about 40,000 deaths do to DUI in the US each year. Obviously
cars are the problem. Should the government come to your house and
confiscate your car?

If the cars did not exist, 40,000 people who died last year would be
alive.

No, he might have left explosives (one of his "interests"), or thrown a
molatov cocktail, or mixed up a toxic gas from recipes on the 'net, or
driven a car into a crowd of students, or any number of other forms of mayhem.

If he had been thrown into jail when he was caught and arrested for
bringing a **stolen** gun to school the day before instead of having his
hands slapped and being sent home to his so-called parents, do you think
he would have been in that cafeteria?

Hi!
If you want 10 mw into 50 ohms you need to see 0.71 volts rms. You need to use an rf probe, not just a voltmeter. Or use a scope but remember that will give you peak to peak so you have to convert.
The formula is ohms law. 0db is 1.0 mw into 50 ohms. Each time a milliwatt level doubles the db figure increases by 3. For example, 2.0 mw is 3db and 4.0 mw is 6 db, etc. Hope this helps.

Burt has no guts to post his drivel on an appropriate news group
where he knows that he will be torn to shreds. There are plenty of
hams over at TPG for him to vent on. It is he that is the wimp and
without guts. I invited him over the last time he posted his rant and
I see that he hasn't had the balls to show up.

I'm a ham in Oregon. I DIDN'T APPROVE OF ANYTHING to do with shooting anyone. Thank you Butt Fisher for your kind, accurate portraying of how we here in Oregon feel about this tragedy. It's so nice to know you are interested and well versed in how we think. You know, there could easily be someone on one of these list that did know a person or the family of a person injured or killed by that kid in Springfield. But then, you are only doing your part to clean up the world, aren't you. Nice to know you care so...

5193. Any book recommendations?

I've tried to pick up the electronics hobby a few times in life, but never got very far. The books I've seen are either so basic to be useless (I know what a capacitor is already!) or are finished schematics with no real explaination of how they work. What I'm looking for is something that will give me enough knowledge to build a receiver and a transmitter from scratch and be able to understand how it works.

For example, I know the basic theory for transmitting is you combine an information signal with a carrier.

1) I know a crystal will oscillate at a fixed frequency, but how else can you make a carrier? How about a variable frequency carrier so you can choose where you transmit?

2) A microphone will turn voice into a varying electrical signal. How do you combine this signal with the carrier? Will this be AM or FM or even PM (phase modulation)?

After that, I guess its all amplification.

Even easier, if I wanted to use CW, I could just turn the carrier wave on and off. That's probably the simplest transmitter to build. So how to you receive this signal? I don't know receive theory at all. In the case of modulating a carrier, how would you subtract the carrier from the signal?

Anyway, this is getting pretty wordy and I think you get the point. So does anyone know of a good book that will explain how and why RF circuits work? Thanks.

And if you feel like answering some of my questions up there, super thanks!

I have seen commercial pagers around work that operate in the 151 MHz region already. You might have an easier time trying to modify one of these. Also, it is not crystal controlled, nor is it in the Ham band, but I have an FM broadcast receiver that fits in my ear. It is basically similar to a hearing aid, but gets FM instead of amplifying the surrounding area. I have wondered if one of these could be modified to get the ham bands.

Good luck,
Ed

Can anyone provide information on how to construct an artifical ground. Also, if you could describe where it is placed in reference to the transmitter and its theory of operation. I would like to experiment with this device to see if it really can help remove rf hot spots in the shack.

Thanks for your time,
Eric
